73449 **Effect of injection level on minority carrier lifetime [solar cells].** S.K.Agarwal, Harsh, S.C.Jain (Solid-State Phys. Lab., Delhi, India), P.De Pauw, R.Mertens, R.Van Overstraeten.
Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.366-70
Results of theoretical investigations of minority carrier recombination at clusters of defects or grain boundaries, at the back contact and in the emitter at different injection levels are given and compared with the experimental results. The values of the effective lifetime increase with injection level when the effect of defect clusters (or grain boundaries) is important whereas they decrease with injection level due to recombinations in the emitter and/or at the back contact. (12 refs.)

73450 Parallel-processing with surface plasmons, a new strategy for converting the broad solar spectrum. L.M.Anderson (NASA Lewis Res. Center, Cleveland, OH, USA).

Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.371-7

A new strategy for efficient solar energy conversion (1) is based on parallel-processing with surface plasmons: guided electromagnetic waves supported on thin films of common metals, like aluminum or silver. The approach is unique in identifying a broadband carrier with suitable range for energy transport, and an inelastic tunneling process which can be used to extract more energy from the more energetic carriers, without requiring different materials for each frequency band. The aim is to overcome the fundamental 56 percent loss associated with mismatch between the broad solar spectrum and the monoenergetic conduction electrons used to transport energy inconventional silicon solar cells. The author presents a qualitative discussion of the unknowns and barrier problems, including ideas which we are testing for coupling surface plasmons into the tunnels, a step which has been the weak link in the efficiency chain. (37 refs.)

73451 Low-cost modular array-field designs for flat-panel and concentrator photovoltaic systems. H.N.Post (Sandia Nat. Labs., Albuquerque, NM, USA), D.C.Carmichael, G.Alexander, J.A.Castle.

Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.378-83

Describes the design and development of low-cost, modular array fields for flat-panel and concentrator photovoltaic (PV) systems. The objective of the work is to reduce substantially the cost of the array-field balance-of-system (BOS) subsystems and site-specific design costs compared with previous PV installations. These subsystems include site preparations, foundations, support structures, electrical wiring, grounding, lightning protection, electromagnetic interference considerations, and controls. To reduce these BOS and design costs, standardized modular ('building-block') designs for flat-panel and concentrator array fields have been developed that are fully integrated and optimized for lowest life-cycle costs. Using drawings and specifications now available, these building-block designs can be used in multiples to install various size array fields. The developed designs are immediately applicable and greatly reduce the array-field BOS costs. (8 refs.)

73452 Characterization of the electrical output of flat-plate photovoltaic arrays. C.C.Gonzalez, G.M.Hill, R.G.Ross,Jr. (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).

Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.384-90

The electric output of flat-plate photovoltaic arrays changes constantly, due primarily to changes in cell temperature and irradiance level. As a result, array loads such as direct-current to alternating-current power conditioners must be able to accommodate widely varying input levels while maintaining operation at or near the array maximum power point. The results of an extensive computer simulation study that was used to define the parameters necessary for the systematic design of array/power-conditioner interfaces are presented as normalized ratios of power-conditioner parameters to array parameters, to make the results universally applicable to a wide variety of system sizes, sites, and operating modes. The advantages of maximum power tracking and a technique for computing average annual power-conditioner efficiency are discussed. (4 refs.)

73453 Improved photovoltaic battery chargers for lower maintenance and higher efficiency. A.R.Millner (TriSolarCorp, Bedford, MA, USA).

Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.400-5

A novel system controller has been developed and tested, suitable for many remote lead acid battery charging applications. The state of charge of the battery is estimated by integrating the battery current, while the optimum amount of equalization charge is simultaneously estimated. The results are bounded by a temperature compensated voltage limit algorithm to ensure convergence of the model to the actual battery being controlled. The battery therefore requires less watering and will probably last longer. The charging mode is further enhanced by a modular high-efficiency switching DC to DC regulator between the source and the battery, driven by a maximum power controller. This allows the photovoltaic array to operate at its optimum voltage regardless of the battery voltage, enhancing the system output during design-limiting winter months. (2 refs.)

73454 Impurities in polycrystalline silicon solar cells. A.Rohatgi, J.R.Davis, R.H.Hopkins, P.Rai-Choudhury (Westinghouse R&D Center, Pittsburgh, PA, USA).

Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.44-16

The effects of grain boundaries and impurities on silicon solar cell performance have been studied in single-crystal and polycrystalline ingots by intentionally incorporating 2×10^{12} cm^{-3} molybdenum, 10^{14} cm^{-3} titanium, and $\sim10^{15}$ cm^{-3} chromium during Czochralski growth. Mo, Ti, and Cr degrade solar cell performance by inducing deep levels in silicon. Electrically active grain boundaries also reduce cell performance by inducing carrier recombination in the bulk as well as in the depletion region of the solar cell. At low impurity concentrations, polycrystalline cell performance is controlled by grain-boundary recombination, while at high concentrations, it is dominated by the impurity, resulting in equal efficiencies for single-crystal and polycrystalline cells. Impurity-grain-boundary interactions are species dependent and result in a decrease in impurity-induced deep-level concentration: Cr exhibits the largest interaction, Ti a weak interaction, and Mo no measurable effect. (16 refs.)

73455 Defect analysis of RTR ribbons. B.L.Sopori, R.J.Ellis, R.N.Legge, K.R.Sarma, I.A.Lesk, C.Ackerman (Solavolt Internat., Phoenix, AZ, USA).

Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.431-6

An analysis of structural defects in RTR ribbons shows that intragrain defects (viz dislocations) play a dominant role in controlling the performance of solar cells. The nature of dislocations, their distribution along different directions, and their dependence on grain orientations in the ribbons are discussed. Characteristics of twins in RTR ribbons and their photovoltaic behavior are identified. (2 refs.)

73456 Operational experience with a 35 kWp concentrating photovoltaic system.

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.184-8

Acurex Corporation completed the installation and startup of a 35-kWp concentrating photovoltaic system in October 1981. This paper describes the operation and performance of the field during the first 6 months of operation. The system has performed at a lower level than predicted, partly due to the unusual climatic conditions experienced at the site. The operational experience indicates three problem areas in the system design. First, some receiver degradation has occurred due to manufacturing defects which have been corrected. Second, the power conditioning unit has demonstrated low reliabiity in the Hawaiian environment. Third, corrosion problems associated with the site have accounted for a major portion of the required maintenance. Overall, the system has operated reliably, except for the power conditioning unit, and most system components do not show signs of degradation. (no refs.)

73457 Field trial of rural solar photovoltaic system. P.Basu, K.Mukhopadhyay, T.Banerjee, S.Das, H.Saha (Dept. of Phys., Univ. of Kalyani, Bengal, India).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.203-9

A small stand-alone solar photovoltaic system using silicon solar cells has been set up in a village near Kalyani, India, to meet two typical rural applications like (a) village community cum adult literacy centre, (b) irrigation pumping. A television set of 65 watts and three fluorescent lamps of total 100 watts and a DC pump set of about 300 watts are being used as load. Power conditioning units include high frequency DC-DC convertor for TV set, DC-AC invertor for fluorescent lamps. Separate storage batteries have been used for the nighttime and daytime load. The performance of solar pump has been investigated for different options like with or without storage battery with a view to determine the cost effective option for stand-alone solar photovoltaic irrigation pumping. The balance of system costs of this system has been estimated and compared with that reported in the USA. The electrical and thermal performances of the solar cell modules have been investigated. The social impact of this system in the village has also been studied. These observations lead to some interesting features of a typical SPS in rural conditions in India. (8 refs.)

73458 Study of a photovoltaic concentrating system like 'SOPHOCLE' in fluctuating mode. B.Laurent, Pham Van Vui, G.Vialaret (Lab. d'Automatique et d'Analyse des Systemes, CNRS, Toulouse, France).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.212-16

SOPHOCLE is a Fresnel lenses concentration photovoltaic generator using silicon cells. It is tested under various climatic environments, by means of a measurement and registration system. The recorded data are treated at LAAS (Laboratoire d'Automatique et d'Analyse des Systemes, Toulouse). Different parameters are studied to define the generator performances and the dispersion of solar characteristics at different places. Their analysis by Monte-Carlo methods has allowed the creation of a mathematical model, particularly for time constants, efficiency and storage. The purpose is to understand at any time the whole behaviour of the system by means of statistics on real data and to detect any eventual defects. (3 refs.)

73459 Performance of 1 kW peak concentrating photovoltaic array. G.Sala, F.Chenlo (Inst. de Energia Solar, Univ. Politecnica Madrid, Madrid, Spain).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.217-21

The RA concentrating photovoltaic array has been measured during its first year of operation. Electrical, optical and mechanical performances are presented. The overall efficiency is 4%. This low value is due to non uniform illumination and to dispersion of the solar cell characteristics. (4 refs.)

73460 Photovoltaic concentrator module characterization. H.J.Gerwin (Sandia Nat. Labs., Albuquerque, NM, USA).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.222-6

A number of photovoltaic concentrator module designs have been tested under similar conditions, and the results are presented to show meaningful performance characteristics. The concentrator designs include actively cooled linear parabolic troughs and linear Fresnel lenses, as well as passively cooled point-focus Fresnel lenses. These modules were produced within the past three years and represent significant improvements over earlier concentrator designs. All testing was performed with natural sunlight in the Sandia National Laboratories test facility in Albuquerque, New Mexico. Each module was run through a series of standard tests to determine performance at normal operating and off-design conditions. These tests included maximum power tracking under a range of insolation values and temperature variations. Complete current-voltage scans were made at frequent intervals throughout the test period for each module. Using a multiple linear regression analysis technique, maximum power efficiencies were determined by normalizing the operating points for direct normal insolation (800 W/m^2) and average cell temperature (28°C). (no refs.)

73461 A microprocessor-based instrument for automatic solar cell characterizatin. G.C.Cardinali (CNR, Istituto LAMEL, Bologna, Italy).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.232-6

The paper describes a microprocessor-controlled instrument for automatic characterization of photovoltaic cells. Accuracy, speed and flexibility, especially as regards run-time selection of measurement and data processing modalities, represent the main characteristics of the proposed system. As output the instrument provides plots of the current-voltage and power-voltage curves, together with information related to the measured data, such as cell fill factor and efficiency. The system turned out to be particularly useful for automatic classification and selection of photovoltaic cells for solar panels. (3 refs.)

73462 Analysis of hot-spot-effects in encapsulated photovoltaic generators by laser scan and partial shadowing. G.H.Hewig, H.-P.Hobner (Inst. fuer Phys. Elektronik, Univ. Stuttgart, Stuttgart, Germany).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.291-5

The connection of several solar cells in a generator implicates some problems unknown to a single solar cell. Due to variations in the short circuit current of the different solar cells, caused either by partial shadowing or variations during the production process, some cells may act as a load, thus resulting in hot-spot-effects. The operating condition of a solar cell in a photovoltaic generator, with the single cells connected either in series or parallel, is analysed. To investigate encapsulated modules, the methods of laser scan and partial shadowing are employed. The combination of both methods yields the short circuit current and the reverse IV-characteristics of each solar cell, which both are important to classify the different cells according to the possible appearance of hot-spots. Hot-spot-effects in Si-solar cell generators are quite possible due to their high shunt resistance, thus withstanding quite high reverse voltages, which may result in a high power consumption of that solar cell, if their short circuit current is lower than the average current of the generator. The possibility of the appearance of hot-spots in a Cu_2S-CdS solar cell generator is much lower due to the fact that thin film solar cells in general show a breakthrough in their reverse characteristic at much lower reverse voltages. (4 refs.)

73463 Reverse bias power dissipation of shadowed or faulty cells in different array configurations [solar cells]. P.Spirito (Istituto Elettrotecnico, Univ. of Naples, Naples, Italy), V.Albergamo.
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.296-300
An analysis has been made of the maximum power dissipation in reverse biased shadowed cells. The results of the analysis are presented for different series-parallel configurations; for each case the bias point of the shadowed cell is determined as a function of the 'shadowing degree', defined as the ratio between the I_{sc} of the shadowed cell and the I_{sc} of the illuminated ones. The maximum power dissipation allowable for the cell in a given module is computed by using the NOCT values of the module itself. The results show that a large paralleling of cells can lead to severe stresses if more than one cell is shadowed, and to a greater sensitivity to the 'hot spot' phenomenon. (5 refs.)

73464 Disequilibriums in series connected solar cells: an approach to the protection by parallel diodes. J.A.Roger, S.Massaad, J.Posbic, J.Pivot (Dept. de Phys. des Materiaux, CNRS, Univ. de Lyon, Villeurbanne, France).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.301-6
This paper presents the first systematic comparison between experiments and theory leading to a better understanding of the 'hot spot' problem in PV arrays, and to a better determination of the major parameters influencing these disequilibriums. Measurements are performed on a single string of 408 series connected solar cells, and currents and dissipated power are recorded as a function of the number of cells that are protected by a given by-pass diode. Experimental data are in a very good agreement with a theoretical approach, summarized here, that allows a more complete investigation: the cell's parameters, especially the shunt resistance, are found to govern the 'hot spot' formation and influence the aptitude of the diode to protect the cells. Various loading conditions are considered, and numerical values are given. This paper describes also the data acquisition system designed in our laboratory, that will be extended to analyze in summer 1982 the mismatch effects and the possible disequilibriums in the 5 kW array of the Refuge des Evettes in France. 73465 The relation between performance and stability of Cd-chalcogenide/polysulfide photoelectrochemical cells. I. Model and the effect of photoetching. R.Tenne, N.Muller (Dept. of Plastics Res., Weizmann Inst. of Sci., Rehovot, Israel), Y.Mirovsky, D.Lando.
J. Electrochem. Soc. (USA), vol.130, no.4, p.852-60 (April 1983).
Photoetching of CdS, CdSe and CdTe electrodes, which is known to improve their quantum efficiency in electrochemical solar cells, is found to improve the electrode stability in polysulfide electrolyte, even though the photocurrent is increased after the photoetching (under constant illumination intensity). A simple model for the performance and the stability of Cd-chalcogenide/polysulfide photoelectrochemical cells is suggested, according to which any parameter that increases the quantum efficiency of the photoelectrode also increases, the electrode stability. Any impediment on the flow of holes into the electrolyte leads to increased photocorrosion and surface recombination. The validity of this model is tested by measuring the quantum efficiency, electrode stability, and photocurrent transients at various light intensities and electrolyte concentrations. (32 refs.)

73466 Coal gasification using solar energy. V.K.Mathur, R.W.Breault, S.Lakshmanan (Dept. of Chem. Engng., Univ. of New Hampshire, Durham, NH, USA).
Sol. Energy (USA), vol.30, no.5, p.433-40 (1983).
A Gas Recirculation Solar Hybrid Technique developed at the University of New Hampshire for the gasification of carbonaceous materials using solar energy is discussed. The cost of substitute natural gas (SNG) manufactured from conventional and hybrid units of 7.08×10^6 m^3 per day (250 MM SCF/D) capacity from various feed stocks has been computed and compared. It is estimated that by 1995 the cost of SNG from a hybrid system will be competitive with conventional gasification systems. The size of the plant versus gas cost has also been studied and it is found that for plants smaller than 0.566×10^6 m^3 per day (20 MM SCF/D) of SNG, the gas cost increases exponentially. A bench scale unit of the UNH Gas Recirculation System for coal carbonization has been tested using an electric heater to simulate solar energy with nitrogen as the heat carrier gas. This study shows the successful carbonization of coal by indirectly transferring simulated solar heat, using the gas recirculation technique. The products obtained are similar to those from a conventional carbonization unit. Our results obtained so far show the UNH Gas Recirculation Solar Hybrid process is economically and technically feasible. (22 refs.)

73467 Solar gasification of carbonaceous materials. R.W.Taylor (Lawrence Livermore Lab., Livermore, CA, USA), R.Berjoan, J.P.Coutures.
Sol. Energy (USA), vol.30, no.6, p.513-25 (1983).
Charcoal, wood and paper have been gasified in a packed-bed reactor using steam and solar energy. The steam was generated by spraying water directly on to the surface of the fuel and, at the same time, heating the fuel at the focus of a solar furnace. Half of the steam reacted with carbon and 30 per cent of the incident solar energy was stored as chemical enthalpy. The performance of a fluidized-bed reactor was compared to that of a packed-bed reactor using charcoal and CO_2. The fraction of the incident solar energy utilized to produce CO (stored) was 10 per cent in the case of the fluidized-bed reactor and 40 per cent for the packed-bed reactor. The fuel value of the gas produced from the steam-gasification of wood and paper was 65 kcal/mole (320 Btu/lb). On an ash free basis the volume yield of the gas was 1 ± 0.1 m^3/kg. (10 refs.)

73468 Energy systems in modular construction. K.G.Heyne, I.-F.Primus (Motoren-Werke Mannheim AG, Mannheim, Germany).
Elektr. Energ.-Tech. (Germany), vol.28, no.2, p.11-15 (April 1983). In German.
The need for economical and fuel-efficient energy supplies has led to the increasing use of newer technical solutions which include combined heat/power generation with internal combustion engines, heat pump installations with internal combustion engines, tandem heat/power stations, pyrolysis plant, refuse utilisation and heating schemes with heat pumps. Rationalisation, standardisation, and the use, where possible, of factory-complete units result in cost effective and environmentally kind schemes. The main constructional features, arrangements, ratings and sizes of a modular system comprising a machine/accessories module, a heat exchanger module and a building module are outlined. (2 refs.) *P.G.R.*

73469 Methods of determining thermodynamic efficiency of compressor-type heat pumps. V.Havelsky.
Energetika (Czechoslovakia), vol.33, no.4, p.141-4 (April 1983). In Czech.
Thermodynamic efficiency of heat-pump cycles as well as the economic aspect of their employment can be assessed on the basis of a knowledge of the actual coefficient of performance, which is a function of the thermodynamic properties of the operating medium and design parameters of a concrete cycle. The author proposes the possibility of determining the actual coefficient of performance by a computing method based on the theoretical Rankine coefficient of performance; the obtained results are comparable with experimental data. In conclusion, the paper discusses the possibility of employing the proposed computing method for the basic computation and design of a concrete heat-pump cycle. (6 refs.)

73470 Refrigerant-absorption pair R22-DEGDME. E.Ando, I.Takeshita (Central Res. Lab., Matsushita Electric Industrial Co. Ltd., Osaka, Japan).
Natl. Tech. Rep. (Japan), vol.29, no.1, p.102-10 (Feb. 1983). In Japanese.
A working fuel has been developed for gas-fired absorption heat pumps with air as a heat source. This system requires a refrigerant and absorbent pair which has the following characteristics: low freezing point (below 0°C), small specific volume and high thermal stability as well as other physical and chemical properties which result in good performance of the system. Combinations of seventy kinds of fluorocarbon compounds as refrigerants and more than one hundred fifty kinds of organic compounds as absorbents were investigated from the above points of view. As a result, a new pair, R22-DEGDME, is viewed as a very promising fluid pair. In order to design this system, data regarding the thermophysical properties, in other words, vapor pressure, specific heat capacity and heat of mixing of ths pair were needed, so they were measured and expressed as functions of temperature and concentration. The equilibrium vapor pressure diagram and the enthalpy-concentration diagram for this pair have been obtained. (9 refs.)

73471 A two-pass solar air heater. A.K.Bhargava (Phys. Dept., Delhi Univ., Delhi, India), H.P.Garg, V.K.Sharma.
Energy (GB), vol.8, no.4, p.267-76 (April 1983).
An air heater, in which the air first flows between metallic and cover plates and is then made to flow between two metallic plates in opposite direction, is discussed theoretically. The governing equations of the model are solved explicitly under suitable conditions. The measured values of the solar isolation and ambient temperature are represented by Fourier series. The effects of collector length and flow rate have been studied. The air heater in this mode of operation is more efficient than one in which air flows between two metallic plates in the same direction, provided the plate length is less than 5 m. (8 refs.)

73472 Solar-selective paints. M.Maki, H.Fukuda, Y.Kaneko (Housing Products Res. Lab., Matsushita Housing Products Co. Ltd., Osaka, Japan).
Natl. Tech. Rep. (Japan), vol.29, no.1, p.69-77 (Feb. 1983). In Japanese.
A solar-selective paint to provide a high absorption over the solar spectrum and reduction of thermal radiative heat losses to solar collector surfaces. Of paints which are available for various present solar collectors, two types of solar-selective paints have been developed. One is applied to a metal surface having high infrared reflection, and the other is applied to a plastic surface having low infrared reflection. These paints can make use of ordinary painting methods and having low infrared reflection. By choosing the optimum paint type in accordance with the uses and the specifications of solar collectors, it has become possible to assemble solar-heat systems with high cost-performance efficiency. (7 refs.)

73473 Monthly average optical efficiency of flat plate collectors. A.A.Sfeir (Dept. of Mech. Engng., American Univ. of Beirut, Beirut, Lebanon).
Sol. Energy (USA), vol.30, no.5, p.397-9 (1983).
Monthly average optical efficiencies of flat plate collectors are expressed analytically in terms of the incidence angle modifier coefficient and geometric factors involving ratios of irradiations on plane of collector to irradiation to a simple expression similar to the equation used to compute the irradiation incident on the collector. The monthly average error introduced by the

approximate form of $\eta_0(\theta)$ is less than 1 per cent for all collector orientations and inclinations used in practice. (5 refs.)

73474 Empirical equations for calculation of CPC collector loss coefficients. C.K.Hsieh (Mech. Engng. Dept., Univ. of Florida, Gainesville, FL, USA), F.M.Mei.
Sol. Energy (USA), vol.30, no.5, p.487-9 (1983).
Presents empirical equations to analyse the thermal efficiency of compound parabolic concentrator collectors because it is a much simpler method than the analytic methods available which entail the simultaneous solution of nonlinear equations. (7 refs.)

73475 Comments on 'Critical thickness of a square section'. C.K.Hsieh.
Sol. Energy (USA), vol.30, no.5, p.491-2 (1983). (2 refs.)

73476 A parametric study on solar ponds. Y.F.Wang, A.Akbarzadeh (Dept. of Mech. Engng., Univ. of Melbourne, Parkville, Victoria, Australia).
Sol. Energy (USA), vol.30, no.6, p.555-62 (1983).
A linear relation between the efficiency of solar ponds and factor $\theta_d/\bar{H}$ which is the temperature difference between the pond bottom and the ambient divided by the average insolation is presented. This relation, which has been developed based on a steady state analysis provides valuable information on the relative importance of the parameters involved in the operation of solar ponds. It is found that the existence and the thickness of the top convective zone has a profound negative effect on the yield of solar ponds. The optimum thickness of the density gradient layer under various conditions is also presented. The effect of ground losses is discussed, and it is shown that for the case of wet soil, especially if the level of the underground water is high, the pond should be thermally insulated. It is also shown that the steady state analysis can predict with good accuracy the yearly average response of solar ponds under transient conditions. (18 refs.)

73477 Thermal model of a cylindrically symmetric solar pond. K.Dhingra, H.C.Bryant (Dept. of Phys. & Astron., Univ. of New Mexico, Albuquerque, NM, USA).
Sol. Energy (USA), vol.30, no.6, p.589-95 (1983).
A finite element heat transport program has been modified to model the thermal behavior for a cylindrically symmetric salt gradient polar pond of the Rabl-Nielsen type. In this model transient phenomena as well as steady state behavior can be studied. Results are presented for a model of the solar pond at the University of New Mexico and are compared with actual measurements. (15 refs.)

73478 Optimal control of solar heating and off-peak energy storage installations. C.B.Winn, R.C.Winn (Dept. of Mech. Engng., Colorado State Univ., Fort Collins, CO, USA).
Trans. ASME. J. Sol. Energy Eng. (USA), vol.105, no.1, p.50-7 (Feb. 1983).
It is well known that the widespread use of solar heating or cooling systems could lead to an increase in the cost of supply of power by the electric utilities. However, it is also recognized that by using appropriate control strategies in these systems the cost of supply may be reduced relative to that of electric resistance heating systems. Control strategies for solar heating systems and for off-peak heat storage systems have been developed and investigated in terms of utility cost of supply for the year 1990. This paper includes a discussion of results obtained for off-peak storage systems, solar heating systems, and combined solar and off-peak systems for the area served by Public Service Co. of New Mexico. (3 refs.)

73479 Appropriate sizing of solar heating systems. P.Bendt (Solar Energy Res. Inst., Golden, CO, USA).
Trans. ASME. J. Sol. Energy Eng. (USA), vol.105, no.1, p.66-72 (Feb. 1983).
It is generally assumed that a solar heating system should be sized by minimizing its life-cycle cost. This study shows, however, that the uncertainty in future economic trends makes the results of such a procedure questionable. The design conditions for minimum cost are extremely broad and all practical systems have a solar fraction within the limited range of 30 to 90 percent. Thus, by choosing only three collector areas that give systems within this range, one is assured of selecting a nearly optimal system for any realistic economic scenario. Selecting one of these three systems is essentially equivalent to economic optimization, but simpler. Procedures are derived in this paper for determining the sizes of the three systems. The conclusion is that the collector areas should be about 1/8, 1/5, and 1/3 of the building floor area. This rule of thumb eliminates the need to design solar systems individually, allowing the possibility of mass-produced homes with standardized solar heating systems. (2 refs.)

86.40 ENERGY STORAGE (SECONDARY ENERGY)

86.40F Storage in thermal energy

73480 Latent heat storage material. T.Wada, K.Matsunaga, F.Kimura, R.Yamamoto, T.Kusuda, Y.Ise (Central Res. Lab., Matsushita Electric Industrial Co. Ltd., Osaka, Japan).
Natl. Tech. Rep. (Japan), vol.29, no.1, p.58-68 (Feb. 1983). In Japanese.
The authors have succeeded in preparing a new practical latent heat storage material consisting of sodium acetate trihydrate (melting point: 58°C, heat of fusion: 340 J/cm^3) as a main component, through solving the two difficult problems of supercooling and phase separation which are encountered in applying salt hydrates for latent heat storage. Practically, the crystal nucleation catalyst for sodium acetate trihydrate, sodium acetate trihydrate melt from supercooling, and the thickener mainly consisting of polyvinyl alcohol preventing thermal capacity of sodium acetate trihydrate from decreasing with cycling have been developed. This new latent heat storage material keeps working stably after 1000 thermal cycles. Further, it is found that urea lowers the melting point of sodium acetate trihydrate without decreasing its heat of fusion significantly. The eutectic mixture of the pseudobinary system $CH_3CO_2Na\text{-}3H_2O\text{-}CO\ (NH_2)_2$ (eutectic point: 31.5°C, heat of fusion, 292 J/cm^3) is well suited for storing low temperature heat such as solar energy in winter. (28 refs.)

73481 A simple computer program to model three-dimensional underground heat flow with realistic boundary conditions. P.D.Metz (Solar & Renewables Div., Brookhaven Nat. Lab., Upton, NY, USA).
Trans. ASME. J. Sol. Energy Eng. (USA), vol.105, no.1, p.42-9 (Feb. 1983).
A FORTRAN computer program called GROCS (Ground Coupled Systems) has been developed to study three-dimensional underground heat flow. Features include the use of up to 30 finite elements or 'blocks' of earth which interact via finite difference heat flow equations and a subprogram which sets realistic time and depth-dependent boundary conditions. No explicit consideration of moisture movement or freezing is given. GROCS has been used to model the thermal behavior of buried solar heat storage tanks (with and without insulation) and serpentine pipe fields for solar heat pump space conditioning systems. The program is available independently or in a form compatible with specially written TRNSYS component TYPW subroutines. This paper first describes the approach taken in the design of GROCS, the mathematics contained and the program architecture. Then, the operation of the stand-alone version is explained. Finally, the validity of GROCS is discussed. A companion paper serves as a user's guide to the TRNSYS compatible subroutine version. (27 refs.)

86.40K Hydrogen storage and technology

73482 Reaction furnace for hydrogen production. J.Kohoutek, M.Seidl, M.Odstrcil.
Czech. Heavy Ind. (Czechoslovakia), no.4, p.33-7 (1983).
Describes the design of a reaction furnace for hydrogen production. The radiation chamber is designed as a multi-row one with ceiling burners and exhaust of the combustion products through tunnel arranged in the bottom between the rows of tubes. The outlet header system is mounted on bearings permitting expansion in all directions. This design reduces the bending stress of the reaction tubes from the expansion movements. (no refs.)

73483 Metal hydride energy-technological treatment of hydrogen. S.S.Solovei.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.3, p.77-80 (1983). In Ukrainian.
An external and internal irreversibility of the compression cycle for heat utilization effectiveness in a metal hydride heat power installation is analyzed. Properties of a working fluid and also the design of metal hydride elements are shown to affect the thermodynamic performance of the heat power installation for hydrogen power processing. (4 refs.)

73484 The effect of glucose concentration and pH on hydrogen production by Rhodopseudomonas sphaeroides VM 81. A.Margaritis, J.Vogrinetz (Chem. & Biochem. Engng., Univ. of Western Ontario, London, Ontario, Canada).
Int. J. Hydrogen Energy (GB), vol.8, no.4, p.281-4 (1983).
The anaerobic photosynthetic bacterium Rhodopseudomonas sphaeroides was used to produce hydrogen gas from glucose. Light served as an energy source for the bacterium to synthesize ATP through photosynthetic phosphorylation. A new strain was developed R. sphaeroides VM81 through successive culturing and adaptation to glucose growth, which gave high yields and rates of hydrogen production. This paper reports optimization experiments on the growth and hydrogen production of R. sphaeroides VM81 at different initial glucose concentrations and pH. The optimum conditions for cell growth and hydrogen gas production were found to be at 7 g glu/l and pH=7.2. (13 refs.)

73485 Cost-effective methods for hydrogen production. R.G.Minet, K.Desai (Kinetics Technol. Internat. Corp., Pasadena, CA, USA).
Int. J. Hydrogen Energy (GB), vol.8, no.4, p.285-90 (1983).
Hydrogen is the key element in the upgrading processes for heavy oils, synthetic fuels, oil shale, tar sands and unconventional raw materials for liquid fuels preparation. Producing hydrogen in bulk from various hydrocarbon feedstocks requires serious evaluation of alternate processing routes to determine the most favorable economic impact on the overall system. This paper discusses several commercially proven systems for large-scale hydrogen plants including partial oxidation of heavy feedstocks, steam reforming combined with several options such as wet system processing, Pressure Swing Adsorption, high and low temperature shift, and the influence of product purity. The comparisons include process descriptions, operating cost factors and overall efficency evaluations. (4 refs.)

73486 The hydrogen economy: future policy implications. L.A.Slotin (Ministry of State, Sci. & Technol., Ottawa, Ontario, Canada).
Int. J. Hydrogen Energy (GB), vol.8, no.4, p.291-4 (1983).
The acceptance of hydrogen as a viable energy option has ramifications which go far beyond the scientific and technical. Consistency with national goals, legal, social and environmental consequences and the implications for the entire energy resource base are some of the aspects which must be carefully considered in pursuing hydrogen as an energy option. (no refs.)

73487 Ti-Mn alloy hydrides and their applications. T.Gamo, Y.Moriwaki, N.Yanagihara, T.Iwaki (Central Res. Lab., Matsushita Electric Industrial Co. Ltd., Osaka, Japan).
Natl. Tech. Rep. (Japan), vol.29, no.1, p.78-92 (Feb. 1983). In Japanese.
Already developed Ti-Mn alloys are expected to be used as hydrogen storage and transportation materials due to their features of low cost and large hydrogen capacity. Concerning the hydrogen absorption-desorption cyclic degradation properties, the hydrogen purification effect and hydriding (or dehydriding) reaction speed of Ti-Mn based hydrides, a major systematic study has been attempted from the viewpoint of use. As a result, the following properties have been obtained: the degradation of hydrogen capacity is only 30% for Ti-Mn binary alloy and 20% for Ti-Mn multicomponent alloys after approximately 10000 cycles. The purity of the hydrogen released from Ti-Mn alloy hydrides easily exceeds 99.9999% in comparison with 99.99% of introduced commercial grade hydrogen; the hydriding (or dehydriding) reaction speed is more than 500 ml/g.min. These results prove that Ti-Mn alloys are superior to known hydrides, Ti-Fe alloys and rare earth alloys, in not only the fundamental material properties but also in the practical characteristics. 73488 The geochemistry of plutonium in fresh and marine water environments. E.R.Sholkovitz.
Earth-Sci. Rev. (Netherlands), vol.19, no.2, p.95-161 (April 1983).
The chemical behaviour of plutonium in the hydrosphere is a subject of both great practical and intrinsic importance. The objective of the paper is to provide a synthesis and critical examination of currently published data and interpretations on the geochemistry of Pu in natural waters and sediments. Where appropriate, an attempt is made to reinterpret published data with the aim of establishing the relationships between geochemical and biological processes and the distribution, concentration and speciation of Pu. Particular attention is paid to the question of the potential for the chemical remobilization of Pu from the solid to the aqueous phase. Approximately one-third of the text deals with freshwaters (mostly lakes) while two-thirds discusses the estuarine, coastal and open ocean environments. (147 refs.)

73489 Dispersion of suspended matter in a homogeneous water flow. O.I.Samsonov (Moscow Inst. of Water Transport Engrs., USSR).
Sov. Meteorol. & Hydrol. (USA), no.2, p.64-71 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.2, p.82-90 (1982).
The possibility of using two-dimensional and one-dimensional equations of conservation of suspended matter for numerical analysis of the dispersion of suspended matter in homogeneous flows is discussed. It is observed that little work has been done on calculation of suspended-matter distributions with allowance for exchange of sediment between the flow and the bottom of the basin. A modified procedure is proposed for calculating the dilution of effluents in projecting the distribution of fine fractions of soil stirred up in dredging operations. (20 refs.)

73490 Transport of phosphorus in surface runoff as influenced by liquid and solid fertilizer phosphate addition. A.N.Sharpley (Southern Plains Watershed & Water Quality Lab., USDA-AR, Durant, OK, USA).
Water, Air & Soil Pollut. (Netherlands), vol.19, no.4, p.321-6 (May 1983).
The effects of superphosphate applied as a liquid or a solid, on the transport of dissolved and particulate P in surface runoff from established pasture were evaluated using the field plots and natural rainfall. An approximately 3-fold increase in the transport of both dissolved inorganic P and particulate *P* in surface runoff was measured in 14 weeks following fertilizer application in the solid form (2.9 and 2.9% of the applied fertilizer P, respectively) compared to the liquid application (1.0 and 1.1% of the applied fertilizer P, respectively). In addition, the application of solid fertilizer P had a more sustained effect on the concentration of both dissolved and particulate P in surface runoff. The results are discussed. (18 refs.)

73491 Macrobenthos of Lake Naini Tal (UP, India) with particular reference to pollution. P.K.Gupta, M.C.Pant (Dept. of Zoology, Kumaun Univ., Naini Tal, India).
Water, Air & Soil Pollut. (Netherlands), vol.19, no.4, p.397-405 (May 1983).
The important attributes of macrobenthic community struture , namely species composition and number, population density, biomass and dominance and diversity indices were measured at different depths and discussed in relation to pollution of Lake Naini Tal. The zone below 7 m depth, where anoxic conditions prevailed for most part of the year, showed complete absence of macrobenthos. (16 refs.)

73492 Aromatic diesel emissions as a function of engine conditions. T.E.Jensen, R.A.Hites (Dept. of Chem., Indiana Univ., Bloomington, IN, USA).
Anal. Chem. (USA), vol.55, no.4, p.594-9 (April 1983).
The abundance and distribution of the alkyl homologues of polycyclic aromatic hydrocarbons (naphthalene, fluorene, phenanthrene, pyrene, fluoranthene, and phenylnaphthalene) and oxygenated polycyclic aromatic hydrocarbons (naphthalenecarboxaldehydes, fluoren-9-one, biphenylcarboxaldehydes, phenanthrenecarboxaldehydes and thioxanthen-9-one) in the organic extractables of particulates produced by a diesel engine are reported. Samples were obtained at three engine loads and at three fuel injection timing conditions. The concentrations of alkyl homologues of PAH and oxy-PAH on the particulates were found to decrease as cylinder exhaust temperature increased. The degree of alkylation for the most abundant homologue of these compounds increased by one to two carbons as the cylinder exhaust temperature was decreased. (23 refs.)

73493 Determination of oxygenated polycyclic aromatic hydrocarbons in airborne particulate matter by capillary gas chromatography and gas chromatography/mass spectrometry. J.Konig, E.Belfanz, W.Funcke, T.Romanowski (Fraunhofer-Inst. fur Toxikologie und Aerosolforschung, Munster-Roxel, Germany).
Anal. Chem. (USA), vol.55, no.4, p.599-603 (April 1983).
By use of a two-step column chromatographic separation of crude extracts from airborne particulate matter, a special fraction was separated which contained mainly oxygenated polycyclic aromatic hydrocarbons (OXPAH). The analysis was made by capillary gas chromatography (GC) and capillary gas chromatography/mass spectrometry (GC/MS). A total of 38 individual compounds belonging to five different groups of substances (ketones, quinones, anhydrides, coumarines, and aldehydes) were characterized by their retention indexes and mass spectra. (36 refs.)

73494 HCl in rocket exhaust clouds: atmospheric dispersion, acid aerosol characteristics, and acid rain deposition. G.L.Pellett, D.I.Sebacher, R.J.Bendura, D.E.Wornom (NASA, Langley Res. Center, Hampton, VA, USA).
J. Air Pollut. Control Assoc. (USA), vol.33, no.4, p.304-11 (April 1983).
Examines Space Shuttle launch impacts. Solid rocket exhaust includes ~60 tons HCl and ~87 tons alumina particles emitted below 2.5 km, of which 50-80% forms an altitude stabilized exhaust cloud (EC). Several 60% smaller Titan-III EC were sampled by aircraft for this study. Three distinct features are presented: (a) An analysis of HCl (gaseous plus aqueous) data traces. (b) An analysis of simultaneous HCl (g), HCl (g+aq) data for 2 EC. (c) An analysis of wet deposition after EC interception at ~30 min by a convective storm. (30 refs.)

73495 Scattering of radiation by particles in low-altitude plumes. R.B.Lyons (Centre for Electro-Optical Studies, Aerodyne Res. Inc., Billerica, MA, USA), J.Wormhoudt, J.Gruninger.
J. Spacecr. & Rockets (USA), vol.20, no.2, p.189-92 (March-April 1983).
The exhaust flowfields of solid propellant missiles may contain substantial amounts of alumina or other particles that scatter photons and, therefore, influence the radiation transport processes in such plumes. The authors study the modification of the aspect angle dependence of the plume radiation signature, especially close to nose-on viewing when particle scattering is included. Two calculational techniques were used to model radiation transport in missile exhaust plumes: the single scattering algorithm incorporated into the existing radiation code and a Monte Carlo simulation. The Monte Carlo simulation can provide as exact a solution to any specified radiative transfer problem as finite computation time will allow; however, it has been restricted to plumes modeled as a single cylinder with uniform concentration and temperature. The ARC formulation, on the other hand, is accurate only if multiple scattering is negligible, but provides fast estimates of radiation, including particle scattering in both simple plume models and complete missile exhaust flowfields. The Monte Carlo calculations serve to test the accuracy of the single-scattering model. (9 refs.)

73496 Acid rain deposition patterns in the continental United States. J.Wisniewski (Flow General Inc., McLean, VA, USA), E.L.Keitz.
Water, Air & Soil Pollut. (Netherlands), vol.19, no.4, p.327-39 (May 1983).
Acid rain has become a major environmental concern, the current extent of which is illustrated. Maps of both pH and H^+ deposition in precipitation are developed for the continental United States by analyzing laboratory pH data from nine precipitation chemistry networks and two single stations spread across the continental United States and southern Canada during the late 1970s. Average laboratory pH values are obtained or calculated for approximately 100 stations, and isopleths of weighted mean pH and mean annual H^+ deposition in precipitation were drawn. (28 refs.)

73497 Heavy metal and sulphur concentrations in Sphagnum magellanicum Brid. in the Maritime Provinces, Canada. K.E.Percy (Canadian Forestry Service, Dept. of the Environment, Fredericton, NB, Canada).
Water, Air & Soil Pollut. (Netherlands), vol.19, no.4, p.341-9 (May 1983).
A regional survey of selected heavy metals and S concentrations in Sphagnum magellanicum Brid. was completed within the Maritime Provinces, Canada. The concentrations of Cd, Co, Cr, Cu, Fe, Hg, Mn, Ni, Pb, S, and Zn were used to describe regional atmospheric deposition patterns to the terrestrial surface. There are measurable inputs of all elements. The elements were accumulated in the order S>Fe>Mn>Zn>Pb>Cu>Ni>Cr>Co>Hg>Cd. (24 refs.)

73498 The problem of aliasing in inferring long-range air pollution transport to Mauna Loa, Hawaii. M.Darzi, J.W.Winchester (Dept. of Oceanography, Florida State Univ., Tallahassee, FL, USA).
Water, Air & Soil Pollut. (Netherlands), vol.19, no.4, p.407-9 (May 1983).
Choice of sampling strategy or criteria for selection of aerosol concentration data from a time series record can lead to errors in estimating periodic regularities because of aliasing. By means of an example from Mauna Loa Observatory during spring dust transport from Asia, it is shown that the detection of possible transport of pollution S across the Pacific to Hawaii could be missed through inadvertent aliasing errors. (see also 43.50 Noise, its effects and control)

73499 Time-of-day corrections in measures of aircraft noise exposure. R.B.Bullen, A.J.Hede (Nat. Acoustic Labs., Millers Point, Australia).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1624-30 (May 1983).
Results of socio-acoustic study of human reaction to aircraft noise around Australian airports are described. The relative importance of night, evening, and daytime operations in determining overall reaction is assessed using a correlation analysis procedure. The results indicate that night-time weightings used in most existing noise exposure indices including NEF and DNL, are too large. However, other evidence suggests that both night and evening weightings should be greater than 0 dB. The optimal weightings found were about 3 dB for night-time operations and 9 dB for evening operations. However, other considerations indicate that in a practical noise index it may be more reasonable to apply a weighting of about 6 dB during both night and evening hours. (13 refs.)

73500 **SnO_2 sputtered film gas sensor.** T.Sotomura, K.Ariga, S.Sekido (Central Res. Lab., Matsushita Electric Industrial Co. Ltd., Osaka, Japan).
Natl. Tech. Rep. (Japan), vol.29, no.1, p.137-44 (Feb. 1983). In Japanese.
Through a high temperature heating process at 600°C, a SnO_2 thin film formed by a sputtering technique has been obtained with high gas-sensing characteristics. It provides a promising means for detecting the hazardous NO_2 contamination in urban environments. The device can also be used for warning of an oxygen deficient air condition, which is characterized by a low oxygen content of 18 to 19% and a high CO gas content of 10~1000 ppm. The gas-sensing device, furthermore, makes full use of its real ability when it detects an exhaust gas in which there are both reducing gases, such as CO, and oxidizing gases, such as O_2 and NO_2. Placed in the exhaust of a conventional fossil-fuel burning appliance, this sensor detects the most suitable point of combustion for fuel consumption. (7 refs.)

73501 **Nuclear waste repository characterization: a spatial estimation/identification approach.** J.V.Candy, Nai-hsien Mao (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
IEEE Trans. Geosci. & Remote Sensing (USA), vol.GE-21, no.2, p.191-200 (April 1983).
The authors consider the application of spatial estimation techniques to groundwater aquifer and geological borehole data. The adequacy of these techniques to reliably develop contour maps from various data sets is investigated. The estimator is developed theoretically in a simplified fashion using vector-matrix calculus. The practice of spatial estimation is discussed and the estimator is then applied to a groundwater aquifer system and a deep geological formation. It is shown that the various statistical models must first be identified from the data and evaluated before reasonable results can be expected. (21 refs.)

73502 **Radionuclide transport processes in terrestrial ecosystems.** F.W.Whicker (Dept. of Radiology & Radiation Biology, Colorado State Univ., Fort Collins, CO, USA).
Radiat. Res. (USA), vol.94, no.1, p.135-50 (April 1983).
Some major principles and the status of knowledge concerning the transport of radionuclides through terrestrial ecosystems are reviewed. Fundamental processes which control the flow of radionuclides between ecosystem components such as air, soil, plants, and animals are described, with emphasis on deposition, resuspension, plant uptake, ingestion, and assimilation. Properties of radionuclides, organisms, and ecosystems are examined in relation to their influence on the accumulation of radioactive materials by plants and animals. The effects of the physicochemical nature of the radionuclide; morphology, physiology, and behavior of the organism; and soil, nutrient, and trophic characteristics of the ecosystem are highlighted. Observations in natural ecosystems on radionuclides such as ^{137}Cs, ^{90}Sr, ^{131}I, ^{3}H, and ^{239}Pu are used to illustrate current concepts. An assessment of the degree to which the processes controlling radionuclide behavior are understood and of one's ability to simulate and predict such behavior with computerized models is offered. Finally, brief comments are made on research needs. (47 refs.)

73503 **A contribution to the theory of anthropogenic effects on local meteorological processes in a city.** M.E.Beryland, M.N.Zashikhin (Main Geophys. Obs., USSR).
Sov. Meteorol. & Hydrol. (USA), no.2, p.1-10 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.2, p.5-16 (1982).
The changes in the meteorological regime of cities that result from air pollution, urban construction, changes in the nature of heat and moisture exchange, and the release of heat as a result of human economic activity are the subject of a theoretical investigation. The studies are based on the numerical solution of a system of motion, heat- and moisture-input, and radiation-transfer equations including the variations of the underlying-surface radiation balance over the day and the influence of the surface airflow from the environs of the city. Analysis of the calculations makes it possible to consider problems of heat-island formation in the city and to investigate the way in which the diurnal variations of air temperature, wind velocity, and the exchange coefficient differ between the city and its environs, as well as the formation of radiation fogs and their interaction with the heat island. (19 refs.)

73504 **Inadvertant effect of large cities and industrial centers on precipitation.** I.V.Litvinov.
Sov. Meteorol. & Hydrol. (USA), no.3, p.92-102 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.3, p.111-19 (1982).
The literature data on changes in the intensity of precipitation-formation processes and total precipitation in the region of large cities and industrial centers are examined. The possible causes of these changes are discussed and it is shown that the structure of urban buildup and heat liberation has the main effect. (89 refs.)

87.10 GENERAL, THEORETICAL, AND MATHEMATICAL BIOPHYSICS

(inc. logic of biosystems, quantum biology, and relevant aspects of thermodynamics, information theory, cybernetics, and bionics)

73505 **The measurement accuracy required for acceptable estimation of steady and non-steady rates of appearance and disappearance from the inaccessible compartment of an open, two-compartment system.** R.Wootton (Radioisotopes Div., MRC Clinical Res. Centre, Harrow, England).
Clin. Phys. & Physiol. Meas. (GB), vol.4, no.2, p.141-9 (May 1983).
A two-compartment system for measuring non-steady state turnover rates was examined by computer simulation. Tracee appears de novo in a compartment to which the experimenter has no access, and from which material is irreversibly lost. In the steady state, Monte Carlo analysis showed that the compartment sizes and fluxes could be determined by tracer experiments with reasonable accuracy. In contrast, under non-steady state conditions, the results proved extremely sensitive to observational uncertainties. Given perfectly accurate input data, simulation showed that the calculated turnover rates agreed closely with the true answer, although not perfectly because of the necessity for interpolation. Contaminating the input data with a single erroneous observation of either tracee or tracer concentration produced large, spurious oscillations in the calculated turnover rates, the duration of which was inversely proportional to the frequency with which the infused compartment was sampled. Contaminating the input data with observational noise of a magnitude likely in practice so degraded the results that they became almost unuseable. It is concluded that non-steady state measurements are feasible using this model, but that rapid sampling and random uncertainties smaller than 1% (coefficient of variation) are desirable in the measurement of tracer and tracee concentration. (11 refs.)

73506 **Theorems on amplification of fluctuations and their biological implications.** Huang Wi-tze (Inst. of Biophys., Acad. Scinica, Beijing, China).
Commun. Theor. Phys. (China), vol.1, no.1, p.87-95 (1982).
Three theorems are proposed: (1) Amplification of a fluctuation is possible within a closed system. (2) The second-order time derivative of Boltzmann's H-quantity may contain terms of negative value. (3) An H-theorem for open systems. Nonsimilarity is also a fundamental reason why phenomena defying the thermodynamic law in an apparent way (such as life) exist in the course of evolution. It is speculated that certain key biomolecules such as ATP are situated at long lifetime excited states, thus at states far from thermal equilibrium. The biomolecules are large fluctuations produced or amplified during a relaxation process starting from an extreme initial state, and stabilized by solar radiation. (10 refs.)

73507 **Mossbauer absorption in overdamped harmonically bound particles in Brownian motion.** I.Nowik, S.G.Cohen, E.R.Bauminger, S.Ofer (Racah Inst. of Phys., Hebrew Univ., Jerusalem, Israel).
Phys. Rev. Lett. (USA), vol.50, no.19, p.1528-31 (9 May 1983).
Recent Mossbauer studies of ^{57}Fe in a variety of biological systems, including proteins and membranes, reveal absorption spectra consisting of a narrow 'elastic' part and a wide 'inelastic part'. These results are interpreted by a model of bounded diffusion in which overdamped harmonically bound particles are in Brownian motion. Excellent fits to experimental data are obtained, which yield values of the mean square displacement $\langle x^2 \rangle$ and diffusion coefficient D of the particles. (14 refs.)

(see also 36.20 Macromolecules and polymer molecules)

73508 **Conformational dynamics of proteins and elementary molecular 'machines'.** K.V.Shaitan, A.B.Rubin (Biology Faculty, Lomonosov State Univ., Moscow, USSR).
Biophysics (GB), vol.27, no.3, p.393-8 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.386-90 (1982).
The stochastic character of the dynamics of the macromolecules and the coupling of functional activity and conformational mobility of proteins are discussed. An equation is obtained and solved describing the work of a very simple molecular 'machine' which may also be interpreted as an equation of motion for the conformon. (13 refs.)

73509 **Thermodynamic parameters characterizing the interaction between the ligand molecules adsorbed on a polymer.** Yu.D.Nechipurenko (Inst. of Molecular Biology, Acad. of Sci., Moscow, USSR).
Biophysics (GB), vol.27, no.3, p.398-406 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.391-8 (1982).
A procedure is worked out for finding the potentials of paired interactions between the ligand molecules adsorbed on a polymer. A method is proposed for describing such interactions with the aid of the potentials of the simple forms—rectangular and trapezoidal. It is shown that if the interactions spread over distances much larger than the mean distances between the adsorbed molecules adsorption is described by an equation characteristic of noncooperative binding of ligands. On this basis the author develops a method of analysing the experimental adsorption isotherms enabling one to determine the energy of interaction between the adsorbed ligand molecules and the characteristic distance over which such interactions spread. This method is used to analyse the experimental adsorption isotherms of the antibiotic distamycin A on poly(dG).poly(dC). (11 refs.)

73510 **Adsorption of tRNA on silicone-coated porous glass.** T.Mizutani (Faculty of Pharmaceutical Sci., Nagoya City Univ., Nagoya, Japan).
J. Non-Cryst. Solids (Netherlands), vol.55, no.1, p.173-7 (April 1983).
The adsorption of tRNA and composites in a highly concentrated NaCl solution on the hydrophobic silicone-coated porous glass was investigated. The amounts of nucleic acids adsorbed on the column were measured from the difference between the concentration of nucleic acids in the solution applied on the column and the eluent from the column, according to the method of

Messing (1976). Column volume was determined by the elution of Bromphenol blue solution. (13 refs.)

73511 On the dispersion forces between molecules in an active medium. W.L.Schaich (Phys. Dept., Indiana Univ., Bloomington, IN, USA).
Phys. Lett. A (Netherlands), vol.95A, no.2, p.124-6 (18 April 1983).
The theoretical analysis by Frohlich (1972) and by Genzel (1978) of a medium's influence on the dispersion forces between molecules is criticized. A corrected treatment is given for some model systems. No anomalies are apparent. (13 refs.)

73512 Headgroup interactions in mixed phospholipid bilayers. F.Sixl, A.Watts (Biochem. Dept., Univ. of Oxford, Oxford, England).
Proc. Natl. Acad. Sci. USA, vol.80, no.6, p.1613-15 (March 1983).
^{2}H NMR methods have been used to study how bilayer-forming phospholipids interact with each other at the membrane surface. Aqueous dispersions of dimyristoyl-sn-phoshatidylcholine (Myr$_2$-PtdCho), dimyristoyl-sn-phosphatidylethanolamine (Myr$_2$-PtdEtn), and dimyristoyl-sn-phosphatidyl-3-glycerol, specifically deuterated at different positions in their headgroups, give well-resolved ^{2}H NMR powder spectra. These spectra are characteristic of a lipid bilayer with quadrupole splittings that are sensitive to the amplitude of headgroup motion. In binary mixed bilayers of deuterated lipids with an unlabeled component, all parts of the deuterated headgroup monitor the presence of the second lipid from changes in the measured quadrupole splittings. The headgroups of the charged lipids, dimyristoyl-sn-phosphatidylserine and dimyristoyl-sn-phosphatidyl-3-glycerol, interact to the largest extent with the choline moiety of Myr$_2$-PtdCho and the ethanolamine moiety of Myr$_2$-PtdEtn, whereas a somewhat smaller but still marked alteration in headgroup motion was observed in Myr$_2$-PtdCho/Myr$_2$-PtdEtn mixtures. The large changes in the deuterium quadrupole splittings for the zwitterionic lipids after addition of a charged lipid suggest that either a strong perturbation in the hydrogen bonding occurs or changes take place in the water structure at the membrane surface, or possibly both. 87.15B Structure, configuration, conformation, and active sites at the biomolecular level

73513 Configurations of the carotenoid in carotenoproteins from Rhodospirillum rubrum. A resonance Raman study. M.Kito (Faculty of Sci., Kwansei Gakuin Univ., Nishinomiya, Japan), J.Yamashita, Y.Koyama.
Photobiochem. & Photobiophys. (Netherlands), vol.5, no.4, p.209-17 (April 1983).
The resonance Raman spectra of carotenoproteins from Rhodospirillum rubrum were recorded. The carotenoid (spirilloxanthin) in the carotenoproteins showed two bands in the C=C stretching region, i.e. above 1500 cm^{-1}. The one whose frequency is lower (1508 cm^{-1}) and independent of the wavelength of the excitation line was attributed to the all-trans configuration. The other broad band, the frequency of which was 1543, 1536 and 1526 cm^{-1} at 457.9, 488.0 and 514.5 nm excitation, was attributed to an assembly of heterogeneous cis-configurations of the carotenoid. The two bands persisted separately at 1543 (457.9 nm excitation) and 1508 cm^{-1} immediately after rapid extraction of the carotenoid with hexane from the carotenoproteins. However, after keeping the extract overnight in the dark, they changed into a broad profile reaching a peak of 1509 cm^{-1} and having a tail at higher frequencies, which indicates a mixture of cis trans isomers in thermal equilibrium. Therefore, the configurations in the carotenoproteins which give rise to the two separate bands are considered to be stabilized by interaction with the apopeptide. The band at 1543 cm^{-1} appeared and increased in intensity relative to the 1508 cm^{-1} band during treatment of *R.* Rubrum chromatophores with sodium dodecyl sulfate and β-mercaptoethanol. Thus, the cis-configurations in the carotenoproteins are ascribable to the isomerization of the all-trans carotenoid in the solubilizing procedure. (16 refs.)

73514 Evidence for conformational substates of rhodopsin from kinetics of light-induced charge displacement. M.Lindau, H.Ruppel (Max-Volmer-Inst., Tech. Univ. Berlin, Berlin, Germany).
Photobiochem. & Photobiophys. (Netherlands), vol.5, no.4, p.219-28 (April 1983).
Fast electric photosignals with R1 and R2 component were measured in an artificial system formed by fragments of bovine rod outer segments. The kinetics of the R2 generating process could not be described simply by a single exponential function. Evidence is presented which shows that the time course of the R2 charge displacement $Q_d(t)$ should be described by the reciprocal power law $Q_d(t)=Q^\infty[1-(1+k^p.t/n)^{-n}]$ rather than by a sum of exponentials. This time course is interpreted as being due to a distribution of rhodopsin substates with different activation energies. The activation energy of the peak rate constant k^P as well as the absolute rate constants are in very good agreement with the time constants obtained for the meta I-meta II transition when treated as an average first order process. (19 refs.)

73515 Defect structures of the liotropic phases of phospholipids. Ye.V.Kononenko, O.A.Varshavskaya (Kirov Polytech. Inst., Sverdlovsk, USSR).
Biophysics (GB), vol.27, no.3, p.406-12 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.399-403 (1982).
The mutual link between defect structures and relaxation processes on formation of liotropic phases in various systems of phospholipids has been studied. It is shown that the character of the structural disturbances and the kinetics of the textural rearrangements and crystallization significantly depend on saturation of the fatty acid lipid residues. It has been established that the introduction of dimethyl sulphoxide increases by one order the time interval of the existence of the lipid mesophases. The textural rearrangements in all systems are initiated by disturbances of structure. (10 refs.)

73516 Study of the conformational stability of immunoglobulin G in monolayers at the phase boundary between aqueous NaCl and octane. L.V.Chasovnikova, N.A.Matveyeva, V.V.Lavrent'ev (Second Pirogov State Medical Inst., Moscow, USSR).
Biophysics (GB), vol.27, no.3, p.444-50 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.435-40 (1982).
The method of monomolecular layers has been used to study the resistance to surface denaturing of preparations of human and equine immunoglobulin G (IgG) at the separation boundary between aqueous NaCl solution and octane as a function of the pH of the aqueous solutin and the concentration of NaCl. It is shown that as compared with monolayers of these preparations at the aqueous NaCl solution-air phase boundary on a liquid to liquid surface of separation the IgG molecules possess high conformational stability. It was not possible to record disturbance of the native structure of the protein in the 2.8-8.0 pH interval of the aqueous solution at a NaCl concentration of 0.15 M. With increase in the content of NaCl from 0.15 M to 2.0 M at neutral pH the molecules of equine IgG also did not lose their native structure while the human IgG molecules were affected only to a weak degree by surface denaturing. (17 refs.)

73517 Conformational structure of respiratory mucus studied by laser correlation spectroscopy. P.Verdugo, P.Y.Tam, J.Butler (Dept. of Internal Medicine & Biological Structure, Univ. of Washington, Seattle, WA, USA).
Biorheology (GB), vol.20, no.2, p.223-30 (1983). (Proceedings of the Fourth International Congress of Biorheology, Tokyo, Japan, 27 July-1 Aug. 1981).
Samples of respiratory mucus were obtained from the trachea of dogs and patients undergoing bronchoscopy. The samples were studied by laser correlation spectroscopy. The autocorrelation function of laser light scattered by both human and canine respiratory mucus was a single exponential in thick mucus or a double exponential in thin watery mucus. This finding suggests that, as in the case of uterine cervical mucus, the molecular structure of respiratory mucus is an ensemble of entangled, randomly-coiled glycoproteins forming a loose network of variable density rather than a covalently cross-linked molecular network as proposed in earlier studies. (14 refs.)

73518 Concept of conformationally equivalent heminucleotides and its implications in the analysis of the folding of secondary and tertiary structures of nucleic acids. R.Malathi, N.Yathindra (Dept. of Crystallography & Biophys., Univ. of Madras, Madras, India).
Curr. Sci. (India), vol.52, no.2, p.53-7 (20 Jan. 1983).
The secondary structural features of double-stranded helices, both of poly (mononucleotide) as well as poly (dinucleotide) types are illustrated with the aid of distance diagonal plots using the recently developed heminucleotide scheme which affords a common basis for description and analysis of all conformations of nucleic acids. The types of interactions that characterise the major and minor grooves of nucleic acid helices the variations in their positions and widths, the minimum number of residues required for their occurrence etc. which follow as a direct consequence of variations in the sugar residue conformation (ψ,ψ^2) of the nucleotide and the internucleotide phosphodiester (ω',ω) are clearly manifested. These are relevant to an understanding of the possible mode of interactions of molecules like peptides, drugs, metal ions, water etc. in helical grooves of nucleic acids. (11 refs.)

73519 A hypothesis for a double helix in which the two polynucleotide strands intercalate instead of forming base-pairs. M.A.Viswamitra, J.Pandit (Dept. of Phys., Indian Inst. of Sci., Bangalore, India).
Curr. Sci. (India), vol.52, no.5, p.207-9 (5 March 1983).
A proposal is made for a double helical structure in which the two polynucleotide strands intercalate. The repeat unit consists of two nucleotides which show interstrand overlap instead of forming base-pairs. (10 refs.)

73520 The orientational dependence of paramagnetic Mossbauer spectra on a weak magnetic field. Investigations on a metmyoglobin single crystal. S.S.Yakimov, V.M.Cherepanov, M.A.Chuev, A.M.Afanas'ev, F.Parak (I.V. Kurchatov Inst., Moscow, USSR).
Hyperfine Interactions (Netherlands), vol.14, no.1, p.1-6 (April 1983).
Mossbauer experiments were performed on a single crystal of metmyoglobin at 4.2K. A small magnetic field was applied in different orientations. The results show the sensitivity of the Mossbauer spectra to the direction of the field. It was possible to detect the heme normal with respect to the orientation of the myoglobin crystal. (8 refs.)

73521 Transitions and molecular packing in highly purified 1,2-dipalmitoyl-phosphatidylcholine-water phases. I. Transitions, improved phase diagrams, method of packing analysis, molecular structures of diglyceride, and polar regions. N.Albon (Phys. des Liquides, Univ. de Provence, Marseille, France).
J. Chem. Phys. (USA), vol.78, no.7, p.4676-86 (1 April 1983).
Results of extensive studies of phases prepared from highly purified 1,2-dipalmitoyl-*sn*-phophatidylcholine and 1,2-dipalmitoyl-sn-glycerol are presented. The methods used included X-ray diffraction and thermal analysis and both temperature and water content were varied. An improved phase diagram was obtained from thermal data which showed well-defined transitions, and from discontinuities in a plot of bilayer repeat spacings with water content. For analysis of molecular packing the bilayer was divided into diglyceride and phosphorylcholine regions. The properties of the diglyceride regions of both compounds are discussed. Estimates of the size and shape of the polar groups are made and the general principles involved in their packing and the influence of water are discussed. Among new features reported, are the existence of the $0\perp$ close chain packing for the crystalline dipalmitoyl glycerol but not in any lecithin phase. Three single crystal lecithin phases with different water contents were prepared which are more stable than the hexagonal chain phases usually reported in the same regions. These hexagonal phases slowly recrystallize to more stable forms, but are usually obtained on cooling melts or higher temperature phases. The single crystal phases only exist over restricted composition ranges while phases with hexagonal, square, and disordered chain packing can accommodate a variation in water content by a tilt of the chain axes and changes in bilayer thickness. Transition widths vary and are extremely sensitive to impurities. (28 refs.)

73522 Soliton-like processes during right-left transition in DNA. P.Jensen (Inst. for Theoretical Phys., Freie Univ. Berlin, Berlin, Germany), M.V.Jaric, K.H.Bennemann.
Phys. Lett. A (Netherlands), vol.95A, no.3-4, p.204-8 (25 April 1983).
A salt induced right-left conformational change in DNA is discussed. A phenomenological model is presented for the transition in short DNAs. For long DNAs a microscopic model equation of motion is analyzed. Solitary-wave solutions are demonstrated and some experimental implications are emphasized. (17 refs.)

73523 Fibrinogen and fibrin structure and fibrin formation measured by using magnetic orientation. J.-M.Feyssinet (Inst. Nat. de la Sante et de la Recherche Medicale, Dept. de Recherche Fondamentale, Centre d'Etudes Nucleaires, Grenoble, France), J.Torbet, G.Hudry-Clergeon, G.Maret.
Proc. Natl. Acad. Sci. USA, vol.80, no.6, p.1616-20 (March 1983).
Accurate birefringence measurements show that fibrinogen orients to a small degree in high magnetic fields. This effect can be explained as due to the molecule having about 30% (by weight) α-helix oriented relatively parallel to the long axis. Birefringence measurements on fully oriented fibrin suggest that aligned α-helical content is less than that estimated for fibrinogen. But because of limitations in the analysis this difference must be viewed with caution. Highly oriented fibrin results when polymerization takes place slowly in a strong magnetic field. Low-angle neutron diffraction patterns from oriented fibrin made in the presence of EDTA, made in the presence of calcium, or stabilized with factor XIIIa are very similar, showing that the packing of the molecules within the fibers is the same or very similar in these different preparations. The induced magnetic birefringence was used to follow fibrin formation under conditions in which thrombin was rate limiting. The fiber network formed by approximately the gelation point constitutes a kind

of matrix or frame that is largely built upon during the remaining ≈85% of the reaction. After gelation the reaction is pseudo-first order. (31 refs.)

73524 A scanning electron microscopic study of winged twin crystals in the bean legume. M.J.Grimson, H.J.Arnott, M.A.Webb (Dept. of Biology, Univ. of Texas, Arlington, TX, USA).
Scanning Electron Microsc. (USA), pt.3, p.1133-40 (1982).
Kinked and straight twin crystals of calcium oxalate monohydrate found in the mesocarp of the common bean (Phaseolus vulgaris) are described. The crystals are found within a sheath and are therefore termed Rosanoffian crystals. Contact twinning occurs in the crystals by two general crystallographic laws, a mirror-image along a twin plane (kinked) and rotation about a twin axis (straight). The crystals appear to be a model monohydrate twin with a standard twinning plane and twinning angles indicative of the monohydrate. The apparent random distribution of kinked and straight crystals in the tissue suggests that the morphology at the twin plane (i.e., straight vs. kinked) is due more to random thermal influences early in crystal development than to direct genetic control. (29 refs.)

73525 Calcium oxalate (weddellite) crystals in forest litter. H.J.Arnott (Dept. of Biology, Univ. of Texas, Arlington, TX, USA).
Scanning Electron Microsc. (USA), pt.3, p.1141-9 (1982).
Forest litter samples from the Wasatch National Forest of Utah were studied by light and scanning electron microscopy and X-ray powder diffraction. Gymnosperm and aspen leaves in the litter have numerous hyphae growing on their surfaces. These white hyphae are covered with a plethora of needle-shaped crystals. The acicular crystals may reach a length of 22 μm and a diameter of 1 μm; they have a low white birefringence and show acid solubilities that are characteristic of calcium oxalate. By X-ray diffraction the crystals were identified as weddellite (calcium oxalate dihydrate). It was possible to find what appear to be stages in crystal development. The crystals develop inside the hyphae; they grow to an intermediate stage in which the ends cause the extension of the hyphal wall. Following this, the crystals become more and more external. Mature crystals become disassociated from the hyphae and sometimes collect in groups. (22 refs.)

73526 Kinetics of the primary stages of the photocycle of bacteriorhodopsin at low temperatures. B.V.Zubov, N.A.Sulikov, N.M.Chernavskaya, D.S.Chernavskii, I.V.Chizhov (Levedev Phys. Faculty, Moscow, USSR).
Biophysics (GB), vol.27, no.3, p.363-8 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.357-61 (1982).
The kinetics of two primary stages of the photochemical cycle of bacteriorhodopsin has been studied from the changes in the absorption spectra over the temperature range 160-300K. It was found that for the transition $K_{610} \rightarrow L_{550}$ over the whole range studied the dependence of the rate on temperature is described by the Arrhenius law with the activation energy $E_a = 0.68$ eV. For the transition $L_{550} \rightarrow M_{412}$ the value $E_a = 0.69$ eV. The character of the temperature dependence of the rate and amplitude for this transition indicate that at $T \leq 210$K a phasic transition is possible. (14 refs.)

73527 Temperature dependence of the ^{1}H-n.m.r. spectrum of hydrated collagen. Yu.P.Meshalkin, S.P.Gabuda, A.F.Rzhavin (Novosibirsk State Medical Inst. of Inorganic Chem., Acad. of Sci., Novosibirsk, USSR).
Biophysics (GB), vol.27, no.3, p.381-6 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.375-9 (1982).
From analysis of the temperature dependence of the constant of spin-spin interaction (α) it is shown that at temperatures below 265K the probabilities of population of donor (S^+) and acceptor (S^-) adsorption centres on the surface of collagen are respectively $P(S^+) \leq 1/10$, $P(S^-) = 0$ and at temperatures 265-283K $P(S^+) < 1/30$, $P(S^-) = 0$. Above 283K the fine structure of the ^{1}H-n.m.r. spectra disappears, which is explained by the destruction of the clathrate-like structures of the hydrate sheath of protein. (7 refs.)

73528 Binding of Ca^{2+} ions by cow's milk α-lactalbumin: study based on changes in intrinsic protein fluorescence. Ye.A.Permyakov, V.V.Yarmolenko, L.P.Kalinichenko, L.A.Morozova, E.A.Burshtein (Inst. of Biological Phys., Acad. of Sci., Pushchino, USSR).
Biophysics (GB), vol.27, no.3, p.386-92 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.380-5 (1982).
The binding of one Ca^{2+} ion by a molecule of cow's milk α-lactalbumin produces a conformational change reflected in fall in the quantum yield of tryptophan fluorescence of protein and a heavy shift of its fluorescence spectrum to the shortwave side (by ~15 nm). This change may be interpreted as the result of the transfer of one or more surface tryptophan residues within the protein globule into the surroundings containing effectively quenching groups (possibly disulphide bonds). The binding content of Ca^{2+} by α-lactalbumin evaluated from the fluorimetric EGTA and pH titration is $(3\text{-}6) \times 10^8$ M^{-1}. The results obtained suggest that the well known conformational change in the molecule of α-lactalbumin for acid pH is due to the competitive ousting of bound Ca^{2+} by three protons ($pK = 5.0 \pm 0.1$). (17 refs.)

73529 Dielectric studies of sonicated egg yolk lecithin at around 800 MHz. G.S.Chana (Dept. of Phys., King's Coll., London, England), M.Y.Rosseneu, R.J.Sheppard, E.H.Grant.
J. Mol. Liq. (Netherlands), vol.25, no.2, p.103-7 (April 1983).
Dielectric studies have been carried out on aqueous solutions of sonicated egg yolk lecithin (EYL) at a frequency of around 800 MHz; these indicate the presence of water of hydration association with the vesicle. Assuming a simple mixture formula, calculations show that there are around 0.3 g of water of hydration for 1 g of the solute. (10 refs.)

73530 Small-angle X-ray scattering from myosin heads in relaxed and rigor frog skeletal muscles. F.R.Poulsen, J.Lowy (Oxford Res. Unit., Open Univ., Oxford, England).
Nature (GB), vol.303, no.5913, p.146-52 (12 May 1983).
Low-angle X-ray diffraction patterns from relaxed and nonoverlap rigor muscles show a central region of diffuse scattering (disk) which is circularly symmetrical, behaves as solution scattering and comes predominantly from myosin heads. In full-overlap rigor the disk is compressed in the diagonal direction, indicating that the moysin heads have a bent shape and a preferred orientation consistent with a 45° angle of attachment to actin. (37 refs.)

73531 Bathorhodopsin intermediates from 11-cis-rhodopsin and 9-cis-rhodopsin. J.D.Spalink, A.H.Reynolds, P.M.Rentzepis (Bell Labs., Murray Hill, NJ, USA), W.Sperling, M.L.Applebury.
Proc. Natl. Acad. Sci. USA, vol.80, no.7, p.1887-91 (April 1983).
Bathorhodopsin-rhodopsin difference psectra of native 11-cis-rhodopsin and regenerated 9-cis-rhodopsin were measured at room temperature with a double-beam laser psectrophotometer after excitation at 532 nm. A detailed analysis of data obtained at 85 psec after excitation suggests that the bathorhodopsins generated from 11-cis and 9-cis-rhodopsin differ in their extinction coefficients and that their absorption maxima are shifted in wavelength by about 10 nm from one another. The ratio of quantum yields for photochemical production of the 11-cis-bathorhodopsin and the 9-cis-bathorhodopsin approximates 1. Implications that the early photochemical processes in vision are more complex than previously considered are explored. (30 refs.)

87.20 MEMBRANE BIOPHYSICS

73532 Nuclear magnetic relaxivity of chloroplast thylakoid membranes: response to saturating light flashes. R.R.Sharp, C.F.Yocum (Dept. of Chem., Univ. of Michigan, Ann Arbor, MI, USA).
Photobiochem. & Photobiophys. (Netherlands), vol.5, no.4, p.193-9 (April 1983).
Spinach chloroplast thylakoid membranes and oxygen-evolving PS II-enriched membranes were exposed to a series of saturating single-turnover flashes under conditions where water proton spin-lattice and spin-spin relaxation rates ($1/T_1 \equiv R_1$, $1/T_2 \equiv R_2$) were monitored. In membrane preparations devoid of contamination from manganese unrelated to the oxygen-evolving reaction, neither R_1 nor R_2 measurements showed significant flash-induced changes relative to values obtained for dark-adapted controls. When thylakoid membranes were supplemented with Mn^{2+}, flash-induced changes in R_1 could be obtained. These changes do not, however, show an oscillatory behaviour. It is concluded from these experiments that manganese functional in oxygen evolution is not monitored by NMR at 20-30 MHz in single-turnover flash experiments. (21 refs.)

73533 Incorporation of erythrocyte membranes into flat bilayer lipid membranes. I.N.Babunashvili, V.A.Nenashev (Inst. of Biological Phys., Acad. of Sci., Pushchino, USSR).
Biophysics (GB), vol.27, no.3, p.451-5 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.441-4 (1982).
Reports the voltage-current characteristics of flat bilayer lipid membranes modified with vesicles of rabbit erythrocyte membranes containing amphotericin *B* and tetraethylammonium. It is shown that in the course of a few minutes after contact of the vesicles and membrane there is partial fusion of the vesicles with the membrane for which in the region of contact a bilayer forms consisting of a monolayer of the lipids of the erythrocyte membrane and a monolayer of the flat membrane. After a few tens of minutes incorporation of the erythrocyte membranes into the flat membrane is observed either through fusion (uncoiling of the vesicles and their incorporation into the flat bilayer) or incorporation of the closed vesicle. Rise in temperature increases the probability of fusion as compared with incorporation. The closed vesicles are incorporated into the membrane asymmetrically: the area of contact is always less than the area of the non-contacting part. (8 refs.)

73534 Conductivity of model protein-lipid membranes. S.A.Badzhinyan, K.G.Manukyan (Inst. of Biochem., Acad. of Sci., Erevan, USSR).
Biophysics (GB), vol.27, no.3, p.461-5 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.450-3 (1982).
Artificial membranes of proteolipids (p.l.), purified to differing degrees, of bovine cerebral white matter distinguished by the content (72, 50-45 and 15-8 mass%) and the qualitative composition of the lipids bound to them have been

reconstructed. The conductivity of the artificial membranes of all three types of p.l. in 0.1 M solution of the chlorides of alkaline metals is higher by two to three orders than the bilayer membranes of lecithin and the total brain phospholipids, with the highest conductivity being shown in all cases by the p.l. membranes containing 85-92 per cent and the least by the p.l. containing 28 per cent of protein. The introduction of the liposomes from a mixture of p.l. and lecithin on one side of the bilayer lecithin membrane leads to gradual rise in its conductivity to a definite high level. The membranes of all three types of p.l. possess specific conductivity for monovalent cations which line up in the following order: $Na^+ > K^+ Cs > Li^+$. (11 refs.)

73535 Study of heat-induced structural rearrangements in the membranes and lipid of lyzosomes in experimental carcinogenesis. N.G.Kotrikadze, G.D.Gabuniya, O.S.Dzhishkariani, M.A.Tsartsidze, B.A.Lomsadze (Tbilisi State Univ., Tbilisi, USSR).
Biophysics (GB), vol.27, no.3, p.465-9 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.454-7 (1982).
Unlike lipid-water systems the structural transitions in lipids are studied in vesicles 'turned' to the outside on the hydrophobic side in an apolar and aprotonic solvent. The link between change in the structure and function of the lyzosome membranes is discussed. (8 refs.)

73536 Possible nature of the fluctuations of the reflective capacity of bilayer lipid membranes excited on electrostriction. V.I.Pasechnik (Phys. Faculty, Lomonosov State Univ., Moscow, USSR).
Biophysics (GB), vol.27, no.3, p.481-7 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.469-74 (1982).
The nature of the fluctuations in the reflective capacity of bilayer lipid membranes (b.l.m.) for light of two different polarizations ($R_\parallel$, $R_\perp$) has been studied. The measurements of the capacitance of the b.l.m. showed that the cophasic fluctuations in $R_\parallel$ and $R_\perp$ appearing with a delay of several milliseconds relative to the moment of delivery to the b.l.m. of an electric field are not connected with the change in the thickness of the bilayer. These fluctuations are apparently due to capillary waves spreading from the tore to the centre of the b.l.m. and changing its curvature. The changes in the latter may be recorded by measuring the reflective capacity of the b.l.m. for a certain adjustment of the apparatus and are interpreted as apparent cophasic changes in $R_\parallel$ and $R_\perp$. (16 refs.)

73537 Theory of electrical breakdown of bilayer lipid membranes. Splitting of the energy barrier. V.F.Pastushenko, Yu.A.Chizmadzhev (Inst. of Electrochem., Acad. of Sci., Moscow, USSR).
Biophysics (GB), vol.27, no.3, p.487-92 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.475-9 (1982).
The free energy of the membrane system is calculated as a function of the pore size. It is shown that allowance for the finite pore conductivity leads to increase in the height of the energy barrier and the calculated lifetime of the membrane in the field. It is shown that there exists a critical value of the parameter $s=\sigma\delta/\gamma$ (σ, γ are the coefficients of the surface and linear tensions, respectively; δ is the membrane thickness), below which in a certain intermediate region of tension the energy barrier is split. Sufficient for this effect is the practically always fulfilled condition of the smallness of the input resistance as compared with the pore resistance for a minimum size of the latter. The relation between the barrier heights depends on the parameter s and the tension, the height of the second barrier falling more rapidly than that of the first with rise in s and tension. (15 refs.)

73538 Use of refractometry for studying phasic transitions in flat lipid membranes. A.I.Khmel'nitskii, S.N.Cherenkevich (Belorussian State Univ., Minsk, Belorussian SSR).
Biophysics (GB), vol.27, no.3, p.570-2 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.550-2 (1982).
The phasic transition of films of lipids of varied origins were studied. To obtain the films the authors used the total lipid and phospholipid fractions, freshly isolated (chromatographically pure) and oxidized phosphatidylcholine of egg yolk and cholesterol recrystallized from acetone. (21 refs.)

73539 Single sodium channels from rat brain incorporated into planar lipid bilayer membranes. B.K.Krueger, J.F.Worley,III, R.J.French (Univ. of Maryland School of Medicine, Baltimore, MD, USA).
Nature (GB), vol.303, no.5913, p.172-5 (12 May 1983).
Presents the first report of electrical recordings from voltage-dependent sodium channels incorporated into planar lipid bilayers. In bilayers with many channels, batrachotoxin (BTX) induced a steady-state sodium current that was blocked by saxitoxin (STX) at nanomolar concentrations. All channels appeared in the bilayer with their STX blocking sites facing the side of vesicle addition, allowing the authors to define that as the extracellular side. Current fluctuations due to the opening and closing of single BTX-activated sodium channels were voltage-dependent (unit conductance, 30 pS in 0.5 M NaCl): the channels closed at large hyperpolarizing potentials. Slower fluctuations of the same amplitude, due to the blocking and unblocking of individual channels, were seen after addition of STX. Block of the sodium channels by STX was voltage-dependent, with hyperpolarizing potentials favouring block. The voltage-dependent gating, ionic selectivity and neutrotoxin sensitivity suggest that these are the channels that normally underlie the sodium conductance change during the nerve impulse. (27 refs.)

87.25 CELLULAR BIOPHYSICS

73540 Chlorophyll *a* in unilamellar vesicles made with chloroplast lipids. Absorbance and photobleaching. R.Carpentier (Centre de Recherche en Photobiophys., Univ. du Quebec, Trois-Rivieres, Quebec, Canada).
Photobiochem. & Photobiophys. (Netherlands), vol.5, no.4, p.245-52 (April 1983).
Vesicles were prepared with lipids extracted from chloroplast membranes including or not including chlorophyll *a*. Some aggregation of vesicles occurred at lipid concentrations higher than 1 $mg.ml^{-1}$. When the chlorophyll/lipid ratio was increased, an absorbance appeared at 700 nm. The photobleaching of chlorophyll was studied in those vesicles. When the chlorophyll/lipid ratio increased, the bleaching decreased (velocity as well as extent). It is suggested that energy dissipation occurs via chlorophyll aggregation and protects the chlorophyll from light. The photobleaching in the vesicles was compared with that in other systems containing chlorophyll *a* in order to evaluate the constituents responsible for chlorophyll photoprotection. (16 refs.)

73541 Light curves of photosynthesis on pulsed illumination. V.I.Zvalinskii, F.F.Litvin (Inst. of Marine Biology, Acad. of Sci., Vladivostock, USSR).
Biophysics (GB), vol.27, no.3, p.418-23 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.410-14 (1982).
A mathematical description of the light curve of photosynthesis on pulsed illumination is proposed for uni- and multicentral organization of the photosynthetic units. It is shown that the form of the curves is determined by the number of photosynthetic units in one domain (degree of multicentrality) and the efficiency of energy migration between them. A criterion for the experimental delimitation of these models is proposed. (8 refs.)

73542 Content of intracellular ATP and the structural state of proteins in the erythrocytic membrane. Ye.I.Slobozhanina, Ye.A.Chernitskii, N.M.Koslova (Inst. of Photobiology, Acad. of Sci., Minsk, Belorussian SSR).
Biophysics (GB), vol.27, no.3, p.434-9 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.425-9 (1982).
The effect of depletion and resynthesis of intracellular ATP on the functional properties of the erythrocytes (filtrability, osmotic stability) and the structural parameters of the membranes isolated from these erythrocytes (spectra of ultraviolet fluorescence, aggregation of proteins determined by gel-electrophoresis) has been studied. It is shown that when the erythrocytes are kept in a glucose-free medium at 37°C they and their membranes show a number of successive changes: crenation and fall in filtrability of the erythrocytes; change in the relative protein composition of the membranes, aggregation of the membrane proteins and shift of their fluorescence spectra to the shortwave side; loss of ability of the erythrocytes to return to the normal state on resynthesis of ATP in them accompanied by fall in the osmotic stability and increase in the filtrability of the cells. It is assumed that the shift of the fluorescence spectra of the membrane proteins is due to the processes of phosphorylation+dephosphorylation and to demonstrate them the paper presents data on the interaction of ATP with the membrane proteins in solution. (11 refs.)

73543 Electron paramagnetic resonance of phosphorylating and non-phosphorylating submitochondrial particles. O.S.Nedelina, Ye.S.Vishnevskii, O.N.Brzhevskaya, E.M.Sheksheyev, L.P.Kayushin (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR).
Biophysics (GB), vol.27, no.3, p.475-8 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.463-6 (1982).
The spin centres associated with the work of ATP synthetase and earlier detected in the mitochondria have been investigated in rat liver submitochondrial particles (s.m.p.) phosphorylating and not phosphorylating. It has been shown that a complex doublet signal with a half width $\sim 38\times10^{-4}$ T is recorded only on the actively phosphorylating and oligomycin-inhibited s.m.p. It has been established that the components of the signal are due to different spin centres, one of which ($g=2.03$) is apparently a metallo-centre, most probably non-haeme iron. The nature of the second doublet characterized by uniformly saturated components with $g=2.03$ and $g=2.00$ is not clear. Study of the saturation of the flavin signal with $g=2.00$ also showed that it consists of two components: one saturated characteristic of non-phosphorylating s.m.p. and the second non-saturated observed in the main in the phosphorylating s.m.p. and probably due to flavin forming part of ATP-synthetase. (8 refs.)

73544 Why is proton magnetic relaxation delayed in tumour cells?. Ye.I.Volkov (Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Biophysics (GB), vol.27, no.3, p.578-9 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.557-9 (1982).
Recently growing interest has been aroused by the use of nuclear magnetic resonance for diagnosing malignant neoplasma. This method is based on the fact that the spin-lattice (T_1) and spin-spin (T_2) relaxation times of the protons of water molecules in malignant tumours are significantly longer than in the corresponding normal tissues. The main experimental facts are listed. The author proposes an interpretation of the n.m.r. experiments in the context of the solid 'carcass' liquid-mosaic models of the membrane developed earlier. (15 refs.)

73545 Settling of fixed erythrocyte suspension droplets. S.N.Omenyi, R.S.Snyder (Space Sci. Lab., Marshall Space Flight Center, Huntsville, AL, USA).
Biorheology (GB), vol.20, no.2, p.109-18 (1983).
The fractionation of micron-size particles according to physical properties of size, density and surface characteristics by centrifugation and electrophoresis is hindered when the particles behave collectively rather than individually. The formation and sedimentation of droplets containing particles is an extreme example of collective behavior and a major problem for these separation methods when large quantities of particles need to be fractionated. Experiments that measured droplet sizes and settling rates for a variety of particles and droplets are described. Expressions are developed relating the particle concentration in a drop to measurable quantities of the fluids and particles. The number of particles in each droplet was then estimated along with the effective droplet density and certain trends are noted. Since a major application of this work is the purification of biological cells in the range of 10 microns, for which monodisperse inert particles are not available, red blood cells from different animals fixed in glutaraldehyde provided model particle groups with the necessary size range, visibility and stability for these fluid dynamical studies. (16 refs.)

73546 The electrophoretic mobilities of minerals determined by laser Doppler velocimetry and their relationship with the biological effects of dust towards macrophages. R.Davies (MRC Pneumoconiosis Univ., Llandough Hospital, Penarth, Wales), A.W.Preece.
Clin. Phys. & Physiol. Meas. (GB), vol.4, no.2, p.129-40 (May 1983).
The role of surface charge in the pathogenicity of mineral dusts has been little studied, partly due to the time consuming nature of such determinations using conventional microelectrophoresis apparatus. In this work the use of

laser Doppler velocimetry proved to be a rapid method of determining the electrophoretic mobility of mineral dusts. Ceramic ball milling of fibrous minerals, whilst dramatically reducing the cytotoxicity of the dusts towards macrophages, had only a small effect on electrophoretic mobility. It is concluded that some other factor, possibly fibre morphology, is important for observed biological effects. The coating of quartz and kaolinite with poly-2-vinyl pyridine-N-oxide dramatically lowered their cytotoxicity towards macrophages. The dusts' electrophoretic mobilities were also lowered. The significance of these findings is discussed. (42 refs.)

73547 Mechanical fatigue as a possible determinant of in vivo longevity of red blood cells. C.K.N.Li, E.K.H.Li (Biological Labs., Harvard Univ., Cambridge, MA, USA).
IEEE Trans. Biomed. Eng. (USA), vol.BME-30, no.4, p.226-8 (April 1983).
Red blood cells lyse when subject repeatedly to osmotic swelling and shrinking. The number of osmotic cycles causing 50 percent of the cells to lyse increases exponentially as the magnitude of swelling decreases. An extrapolation of this relationship to the osmotic volume changes cells experience in vivo gives the survival half life of red cells in circulation. (11 refs.)

87.25D Biological transport; cellular and subcellular transmembrane physics

73548 Ion-exchange ratio and membrane potential in the bacteria S. faecalis. S.M.Martirosov, A.G.Bartanyan, L.S.Petrosyan (Erevan State Univ., Erevan, USSR).
Biophysics (GB), vol.27, no.3, p.479-81 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.467-8 (1982).
The authors have measured the energy-dependent membrane potential $\Delta\psi$ of S. faecalis equal to -140 mV and not changing with change in temperature from 37 to 18°C. In the period of generation of $\Delta\psi$ ion-exchange is observed in the ratio $2H^+$:lac:K^+ where the hydrogen and lactate ions leave the cells. Possibly in the membranes of S. faecalis an electrogenic proton potassium pump operates exchanging $2H^+$ for one K^+ ion of the medium. (5 refs.)

73549 Active transport of triphenylmethyl phosphonium in mitochondria. I.A.Skul'skii, V.V.Glazunov, S.M.Baklanova (Sechenov Inst. of Evolutionary Physiology & Biochem., Acad. of Sci., Leningrad, USSR).
Biophysics (GB), vol.27, no.3, p.492-7 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.480-4 (1982).
It is shown that the energy-dependent accumulation of triphenylmethylphosphonium ($TPMP^+$) in the mitochondria of the rat liver at 0°C is only 30-50 per cent less than at room temperature, but the rate of transport is so reduced as to make possible study of the kinetics of the process. The potassium diffusion potential speeds up the entry and slows the exit of $TPMP^+$ as to be expected for a penetrating cation in an electric field. On the other hand, energization of the mitochondria leading, as is thought, to rise in the membrane potential, hastens the entry of $TPMP^+$ but has no effect on the rate of its exit. These findings are not compatible with the presence of the metabolic membrane potential and indicate the active transport of $TPMP^+$ in mitochondria. Consequently the steady distribution of $TPMP^+$ cannot be used to determine the membrane potential. (12 refs.)

73550 Temperature characterization of oubaine-insensitive sodium flux in frog muscle. T.G.Ambartsumyan, G.G.Marikyan, S.Ya.Adamyan (Erevan Phys. Inst., Erevan, USSR).
Biophysics (GB), vol.27, no.3, p.502-6 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.489-92 (1982).
The authors have studied the anti-gradient efflux of Na^+ ions from Na^+ loaded frog skeletal muscle. It is shown that the oubaine-insensitive nondiffusional efflux of sodium at 22 and 2°C characterized by a low van t'Hoff temperature coefficient $Q_{10}=1.3$. A scheme is proposed according to which transfer of Na^+ ions from the cell into the external solution is carried out in two stages: enzymatic reaction at the inner boundary of the membrane and diffusional escape ions through the sodium channel of the membrane. It is shown that the energy expenditure of the cell going on the translocation of Na^+ through the inner boundary of the membrane into the channel ($\sim$13 kJ/mole) does not depend on temperature but the influence of temperature affects the second stage of ion transfer. (11 refs.)

73551 Electrical simulation for the ionic conductances in the single nerve cell membrane. Kyung-Joung Lee, Jae-Bong Ann, Myoung-Ho Lee.
Trans. Korean Inst. Electr. Eng., vol.31, no.12, p.187-97 (1982). In Korean.
Presents electrical characteristics of the single nerve cell membrane by using an electrical analog model based on the ionic conductances which is proposed by Hodgkin-Huxley. In modeling, the sodium conductance, g_{Na} and the potassium conductance, g_K, which specify the characteristics of the nerve cell membrane, are most important elements. In particular, since g_{Na} and g_K depend on the membrane voltage and the time, the dependences of g_{Na} and g_K both on the membrane voltage and the time was simulated by the FET having the properties that the drain-source conductance, g_{DS} of the FET is controlled by the gate voltage, V_G. Therefore, the dependence of the ionic conductance on the membrane voltage and the time was realized by feeding back the simulated membrane voltage to the gate terminal of the FET. (13 refs.)

87.30 BIOPHYSICS OF NEUROPHYSIOLOGICAL PROCESSES

(exc. perception processes and speech)

73552 The dielectric properties of normal and tumour mouse tissue between 50 MHz and 10 GHz. J.A.Rogers, R.J.Sheppard, E.H.Grant (Dept. of Phys., Queen Elizabeth Coll., London, England), N.M.Bleehen, D.J.Honess.
Br. J. Radiol. (GB), vol.56, no.665, p.335-8 (May 1983).
Microwaves are currently being investigated as a method of inducing hyperthermia. Values of the relative permittivity and conductivity of mouse muscle and tumour tissues over the frequency range 50 MHz to 10 GHz at a temperature of 37°C are reported. The data were obtained by using an on-line computer-based time-domain spectrometer. The tumour tissues were the RIF/1 and KHT fibrosarcomas sited in the hind leg muscle of C3H mice. A significant difference in the relative permittivity between the normal and tumour tissue was shown to exist at frequencies up to 200 MHz. (16 refs.)

73553 Study of the mechanism of the different behaviour of the period of helical excitation waves in the atrium and ventricle. A.K.Grenader, G.G.Zurabishvili (Inst. of Biological Phys., Acad. of Sci., Pushchino, USSR).
Biophysics (GB), vol.27, no.3, p.519-23 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.505-8 (1982).
On strips of the left atrium and wall of the right ventricle of the rabbit heart the sources of helical excitation waves—reverberators—were produced by delivering a single extra stimulus in the vulnerable phase of the action potential. It is shown that the period of the sources T increases in the first seconds after their appearance in atrial tissue and changes little after their appearance in ventricular tissue. The link between the changes in T and the refractoriness of heart tissue is investigated. A model is proposed explaining the different behaviour of T in the atrium and ventricle. (9 refs.)

73554 Stochastic fluctuations in a dynamic system modelling macroscopic activity of nerve tissues. V.I.Sbitnev (Leningrad Konstantinov Inst. of Nuclear Phys., Acad. of Sci., Leningrad, USSR).
Biophysics (GB), vol.27, no.3, p.530-5 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.515-19 (1982).
Stochastic fluctuations may display dynamic systems with a quite simple structure and in which sources of uncontrollable noise are absent. Such fluctuations are shown by the system $Z_{k+1}=(1+\exp(V-HZ_k)^{+1})\ (\mathrm{mod}\ I)$ which differs from the Amari system proposed to describe the macroscopic activity of neuronal nets by adding the term mod I with $I<1$. It has been established that the sequence $Z_1, Z_2 \ldots Z_k, \ldots,$ corresponds to the fluctuations in the postsynaptic potential on the exciting neurons and the operation mod I is due to the regulatory functions of the inhibitory neurones. (19 refs.)

73555 Change in the constant electric field of man during adaptation to conditions of hypokinesia. G.N.Zatsepina, S.P.Kuprin, S.V.Tul'skii, M.N.Flerov (Phys. Faculty, Lomonosov State Univ., Moscow, USSR).
Biophysics (GB), vol.27, no.3, p.536-42 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.520-6 (1982).
The kinetics of change in the constant electric field of man in the course of adaptation to hypokinesia from a normal physical load and vice versa has been studied. It is shown that adaptation—transitional regime from one physiological state to another—shows uniform values of the electrical potential difference (e.p.d.) between fixed points of the human skin. If the body is already in the state of adaptation the superposing of one adaptation process on another does not change the mean values of the e.p.d. of the level of adaptation. The level of adaptation constitutes the upper value for the amplitude of the e.p.d. of the healthy body. (10 refs.)

73556 The physiological (EEG) nature of drowsiness and its relation to performance deficits in narcoleptics. V.Valley, R.Broughton (Dept. of Psychology, Univ. Hospital, London, Ontario, Canada).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.3, p.243-51 (March 1983).
Ten narcoleptics off medication were compared to matched controls to determine the pattern and level of electroencephalographic (EEG) vigilance, and its relation to performance ability on the 1 h Wilkinson auditory vigilance task. The narcoleptics performed significantly more poorly and spent significantly less time in wakefulness than controls. The EEG of the patients revealed continual fluctuations between wakefulness, stage 1A (slowed and diffusing alpha) and stage 1B (theta activity). Stage 2 sleep only occurred briefly in 4 patients. Stages 3, 4 and REM sleep were never encountered. Controls were continually awake aside from very brief appearances of stage 1A in 5 subjects. Narcoleptic performance during stages 1B and 2 was characterized by lapses (response omissions). Patients also demonstrated significantly more lapses as well as false positive responses than controls during wakefulness and stage 1A. Poorer performance even during wakefulness was demonstrated to be related to inability to sustain wakefulness over time. The results clarify the temporal pattern of physiological vigilance during perfor-

mance in narcoleptics and also demonstrate the insufficiency of the lapse-microsleep formulation in explaining performance deterioration in these patients. (35 refs.)

73557 The direction of spread of alpha activity over the scalp. T.Inouye, K.Shinosaki, A.Yagasaki (Dept. of Neuropsychiatry, Osaka Univ. Medical School, Osaka, Japan).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.3, p.290-300 (March 1983).
The direction of spread of alpha activity over the scalp was studied using the modified 'entropy analysis' method which distinguishes the direction of time differences between two correlated signals in the alpha band. The resting EEG was recorded from F3, F4, C3, C4, P3, P4, O1 and O2, each referenced to linked ears in 10 subjects. The directed measure of correlation of alpha activity in two directions (e.g., from O1 and O2 and from O2 to O1) was obtained from all possible pairs of electrodes. The dominant longitudinal direction of alpha activity was found to be anterior to posterior within as well as across hemispheres. No dominant transverse direction was found. This suggests that the spread of alpha activity over the scalp is in the dominant anterior-posterior direction. (23 refs.)

73558 Two types of interictal transients of reversed polarity in rat hippocampus during kindling. W.J.Wadman, F.H.Lopes Da Silva (Dept. of Animal Physiology, Univ. of Amsterdam, Amsterdam, Netherlands), L.-W.S.Leung.
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.3, p.314-19 (March 1983).
Two different types of spontaneous interictal transients (SITs) have been found in the course of the development of an epileptogenic focus by Schaffer collateral kindling in the CA1 region of rat hippocampus. The first type has peak amplitudes of 250 μV up to 1 mV, a duration of about 80 msec and the same polarity as field potentials recorded from the same sites evoked by Schaffer collateral stimulation. These SITs occur early during kindling, but are also observed at later stages. The second type, which is dominant in later stages of kindling, has peak amplitudes of 2-3 mV, a duration of about 20 msec and the opposite polarity; in a later stage it may also contain a clear population spike. Both types can be considered as being caused by equivalent dipoles situated across the pyramidal cell layer of CA1 but with inverted polarities. (22 refs.)

73559 On the possibility to determine integral characteristics of the cardiac electric generator from extracardiac electric and magnetic measurements. L.I.Titomir (Inst. of Problems of Information Transmission, Acad. of Sci., Moscow, USSR), P.Kneppo.
IEEE Trans. Biomed. Eng. (USA), vol.BME-30, no.4, p.222-6 (April 1983).
The relation between the electric and magnetic fields of the heart outside the body is considered on the assumption that the primary bioelectric generators impressed membrane currents may be represented as geometrically curvilinear thread-like flows. An approach based substantially upon the multipole expansion of scalar potentials is developed for distinguishing between two parts of a measured total magnetic field, the first part being uniquely joint with the electric field, and the second being independent and containing information about curvilinearity of the elementary generators. (16 refs.)

73560 Sudden cardiac death: a problem in topology. A.T.Winfree.
Sci. Am. (USA), vol.248, no.5, p.118-31 (May 1983).
Many sudden deaths are the result of fibrillation: a disruption of the coordinated contraction of heart muscle fibers. The cause may lie in a state of affairs described by a mathematical theorem. (no refs.)

87.32 PHYSIOLOGICAL OPTICS, VISION

87.32C Anatomy and optics of the eye

73561 Visual accommodation in the flying fox (Pteropus giganteus). C.J.Murphy (Dept. of Veterinary Anatomy, Cornell Univ., Ithaca, NY, USA), H.C.Howland, G.G.Kwiecinski, T.Kern, F.Kallen.
Vision Res. (GB), vol.23, no.6, p.617-20 (1983).
The flying fox, Pteropus giganteus, possesses a papillated retina and was previously thought to lack a mechanism for active accommodation. An investigation of the anatomy and physiology of accommodation in this megachiropteran bat revealed that it has a well developed ciliary muscle and that it can actively accommodate through a range of at least 3.12 D. In addition, it was found that the origin of the retinoscopic reflex does not reside in the receptor layer of the retina, because the focus of the eye is invariant for small changes of angle of refraction. (11 refs.)

87.32E Physiology of the eye; nerve structure and function

73562 An X-ray study of bleached and unbleached frog retinal photoreceptors as a function of elapsed time. C.R.Worthington, A.R.Czeto (Dept. of Biological Sci. & Phys., Carnegie-Mellon Univ., Pittsburgh, PA, USA).
Photobiochem. & Photobiophys. (Netherlands), vol.5, no.4, p.229-36 (April 1983).
A series of low-angle X-ray diffraction patterns has been recorded from bleached and unbleached frog retinal photoreceptors by using successive X-ray exposures. The disc-to-disc repeat distances show increases with elapsed time. These increases derive from unequal increases in the intra- and interdisc fluid spaces with the disc membrane remaining relatively unchanged in structure. There is a small but definite difference between the electron density profiles of the bleached and unbleached photoreceptors. This difference in profiles is due to an increase of electron density at the membrane surface facing the intradisc space on bleaching. (11 refs.)

73563 Visual and auditory anomalies in Chediak-Higashi syndrome. D.Creel (Dept. of Ophthalmology, Univ. of Utah, Salt Lake City, UT, USA), L.A.Boxer, A.S.Fauci.
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.3, p.252-7 (March 1983).
Albinism is correlated with misrouting of decussating retinal fibers in the brain. There is also evidence of anomalies of decussating auditory pathways in albinos. The Chediak-Higashi syndrome (CHS) is a rare form of partial albinism which includes increased susceptibility to infections, a hemorrhagic tendency and peripheral polyneuropathies. Binocular and monocular pattern-onset visually evoked potentials (VEPs) and monaural auditory brain stem responses (ABRs) were recorded from 4 subjects with CHS. Three of the CHS demonstrated asymmetric monocular VEPs and failed the Titmus stereovision test. All 4 CHS produced asymmetric ABRs similar to those reported for albinos. Although the hair, skin and irises are relatively well pigmented in CHS, these individuals apparently have anomalies of their central visual and auditory pathways. (32 refs.)

73564 Neural mechanisms of pattern vision in the monkey. I. Preface. E.Iwai (Tokyo Metropolitan Inst. for Neurosci., Fuchi, Japan).
J. Inst. Electron. & Commun. Eng. Jpn. (Japan), vol.66, no.1, p.44-6 (Jan. 1983). In Japanese.
Pattern recognition or identification consists in processing information about the pattern through the process of learning; consequently, it can be referred to as a high-level thought process. When a person makes a decision process for visual information, a signal is sent out through his sense system and recognition system, and recognition behaviour is revealed. Such physiological knowledge can be applied to pattern recognition processes in information engineering. (3 refs.) *K.B.*

73565 Coexistence of neurofilaments and vimentin in a neurone of adult mouse retina. U.C.Drager (Dept. of Neurobiology, Harvard Medical Scool, Boston, MA, USA).
Nature (GB), vol.303, no.5913, p.169-72 (12 May 1983).
Different clases of intermediate filaments are restricted to particular cell types. However, evidence is presented here of an exception to that rule in the outer plexiform layer of the mouse retina. Double-labelling with antibodies to neurofilaments and vimentin showed that both types of intermediate filaments coexisted in the axonless horizontal cell of that retinal layer, recalling the previous notion that these cells are glial or intermediate between neuronal and glial (H. Wassle et al., 1978). (19 refs.)

73566 Protons block the dark current of isolated retinal rods. P.Mueller, E.N.Pugh,Jr. (Univ. of Pennsylvania, Philadelphia, PA, USA).
Proc. Natl. Acad. Sci. USA, vol.80, no.7, p.1892-6 (April 1983).
Membrane currents of isolated frog rods were recorded with the suction pipette technique and tested by perfusion techniques for their sensitivity to H^+. The following facts have been established. (*i*) Increased $[H^+]$ suppresses the Na^+ conductance of the outer segment rapidly and reversibly. (*ii*) H^+ acts in the rod interior. (*iii*) The $[H^+]$ necessary to cause a 50% decrement in Na^+ conductance is inversely related to the $[Ca^{2+}]$ over 5 orders of magnitude. (*iv*) The sensitivity to H^+ and the sensitivity to light, as a function of $[Ca^{2+}]$, have the same slope. Thus, H^+ act like light in effecting membrane current suppression but behave as if their effect is mediated through Ca^{2+}. Based on these results and properties of rod disk membrane phosphodiestrase, the authors propose that protons produced in the light-activated hydrolysis of cGMP liberate Ca^{2+} from the disks by ion exchange. (43 refs.)

73567 The neurobiology of image. M.Imbert (Univ. of Paris Sud, Orsay, France).
Recherche (France), vol.14, no.144, p.600-4, 607-13 (May 1983). In French.
Between a light ray hitting the retina at the base of the eye and an image forming 'in the brain' several milliseconds elapse. During this time the light information received undergoes successive treatments. Work in neurophysiology during the last 20 years has started to lift the veil on the working of nerve cells and the retina. The paper deals with the subject generally and it is generously provided with diagrams. The action of the retina is described as a mosaic of receivers. Some experiments carried out on the subject are described and the filter role of the retina is explained. The compression of information by the retina is described, as are the distribution of fibre optics in the brain. Primary vision is explained, as are the sensitivity to contrasts and kindred types of functioning. (31 refs.) *G.V.D.*

73568 Nerve fiber layer of the primate retina: thickness and glial content. T.E.Ogden (Dept. of Physiology, Univ. of Southern California, School of Medicine, Los Angeles, CA, USA).
Vision Res. (GB), vol.23, no.6, p.581-7 (1983).
A topographic map of nerve fibre layer thickness was prepared from serial sections of the retina of the cynomolgus monkey. Montage electron micrographs of the nerve fiber layer were used to determine the relative proportions of axons and of glial processes within a given nerve fiber bundle at various positions across the retina. The cross-sectional area of nerve fiber bundles occupied by glia was never less than 18%, and in most cases was 20-30%. The proportion of glia in the bundles varied from point to point across the retina without respect to nerve fiber layer thickness and at some locations was as much as 42%. (16 refs.)

73569 Pupillary escape intensified by large pupillary size. F.Sun, L.Stark (Dept. of Physiological Optics & Engng. Sci., Univ. of California, Berkeley, CA, USA).
Vision Res. (GB), vol.23, no.6, p.611-15 (1983).
Pupil responses to light are greatly influenced by initial pupil size. Small pupils, operating under photopic conditions, show tonic responses to step increases of light and high gains; thus the pupil is a good regulator of light. Large pupils, operating under mesopic or scotopic conditions show phasic responses, 'pupillary escape', and smaller gains; the pupil only transiently

influences retinal flux. By using accommodation level to set the size of the pupil, the mechanism of the 'pupil size effect' is shown to be dependent on retinal light level only so far as retinal activity sets pupil size. (23 refs.)

73570 The impulse response of a movement-detecting neuron and its interpretation. M.V.Srinivasan (Dept. of Neurobiology, Australian Nat. Univ., Canberra, Australia).
Vision Res. (GB), vol.23, no.6, p.659-63 (1983).
When a visual pattern undergoes a brief displacement, the response of the neuron depends primarily upon the size of the displacement. One measures a tradeoff between velocity and duration of motion, analogous to the reciprocal relationship between intensity and duration in the perception of a brief flash of light (Bloch's law). Characterizing the movement detector by its 'impulse response' could be useful in predicting the response to arbitrary motions. (19 refs.)

87.32L Light detection; adaptation and discrimination

73571 Light and the work environment. H.D.Range (AEG-Telefunken, Springe, Germany).
Elektr. Energ.-Tech. (Germany), vol.28, no.2, p.25-8 (April 1983). In German.
The effect of intensity of illumination of humans with regard to productivity, fatigue, production faults and accidents is considered. The significance, scope and contents of the German Standard DIN 5035 'Interior lighting with artificial light' are outlined, the influence on the work environment is discussed and reference is made to the interrelation with regulations and guidelines. (21 refs.) *P.G.R.*

73572 The development of light adaptation in human infants. J.L.Dannemiller, M.S.Banks (Dept. of Psychology, Univ. of Texas, Austin, TX, USA).
Vision Res. (GB), vol.23, no.6, p.599-609 (1983).
Increment threshold functions were measured from -4.0 to 1.2 log cd/m^2 in 7-12-week-old infants using a behavioral forced-choice paradigm. The slopes of the infant functions were considerably shallower than the slopes of adult functions over the same luminance range. The value of the infant slope increased rapidly between 7 to 12 weeks postnatally. A number of explanations for this developmental shift are considered. It is concluded that changes with age in either spatial summation or intensity-response function gain could cause the increase in slope. (40 refs.)

87.32N Colour detection; adaptation and discrimination

73573 Spatial sensitization and desensitization with small adapting fields: interactions of signals from different classes of cones. C.F.Stromeyer (Div. of Appl. Sci., Harvard Univ., Cambridge, MA, USA).
Vision Res. (GB), vol.23, no.6, p.621-30 (1983).
Thresholds for brief, tiny flashes were measured on small adapting fields at 5° retinal eccentricity. Rod influence was eliminated by bleaching. Green and red small adapting fields raised the threshold for a green test flash by stimulating both middle and long wave cones—thus spatial desensitization by small adapting fields is not cone-specific. However, a small adapting field that strongly stimulated only short wave cones did not affect the visibility of a long wave flash. Spatial sensitization was also measured, using green or red annuli that surrounded a small red field and green test probe. Sensitization was not cone-specific. Possible mechanisms producing desensitization with small fields and annular sensitization are discussed. (45 refs.)

73574 Distinguishing opponent and non-opponent detection pathways in early dark adaptation. A.Reeves (Inst. fuer Arbeitsphysiologie, Univ. Dortmund, Dortmund, Germany).
Vision Res. (GB), vol.23, no.6, p.647-54 (1983).
Desensitization of the red-green opponent pathway was demonstrated in early dark adaptation with the aid of a test chosen to isolate that pathway. Isolation was achieved by requiring the observer to adjust the intensity of a foveal test light to the threshold for flicker, when the test alternated slowly between luminance-matched red and yellow fields. The luminance matches were precise enough that only an opponent pathway could mediate the flicker thresholds. Desensitization occurred after continuous light adaptation to 626 nm fields, but did not occur after adaptation to yellow fields, or if the 626 nm field was turned on and off at 2 Hz throughout adaptation. The properties of the red-green pathway measured with the flicker thresholds resemble those of the yellow-blue pathway as shown in transient tritanopia. (16 refs.)

The possible elemental nature of brown ....See Entry 73577

87.32S Psychophysics of vision, visual perception, binocular vision

73575 Vertical fusional response to asymmetric disparities. A.E.Kertesz, A.L.Perlmutter (Biomedical Engng. Center, Northwestern Univ., Evanston, IL, USA).
IEEE Trans. Biomed. Eng. (USA), vol.BME-30, no.4, p.246-50 (April 1983).
Objective measurement of the human vertical fusional response to asymmetric disparity presentation was carried out. Ramp disparities evoked mostly monocular eye movements. Step disparities evoked binocular eye movements which began with conjugate saccades followed by slower vergence movements. The two saccade amplitudes were approximately equal, and each was greater than half of the disparity. Motor compensation was mostly incomplete, allowing for the existence of a significant sensory component. Slower time course characterized the vertical vergence movements which were otherwise similar to the horizontal motor response to asymmetric disparity presentation. (13 refs.)

73576 Shifts in perceived size due to masking. D.J.Gelb, H.R.Wilson (Dept. of Biophys. & Theoretical Biology, Univ. of Chicago, Chicago, IL, USA).
Vision Res. (GB), vol.23, no.6, p.589-97 (1983).
It has been suggested that perceived size depends upon the distribution of responses among a localized population of different size-tuned mechanisms. If so, then spatial frequency masking, which alters the distribution of response, should produce shifts in a test pattern's perceived size. The authors have found this to be the case. The magnitude and direction of the shifts depend only on the frequency difference in octaves ($\Delta\omega$) between mask and standard. The results are not antisymmetric about the point $\Delta\omega=0$, however, as they would be if perceived size were based purely on local size-tuning properties. The authors' results suggest that size perception depends both on these local properties and on the spatial distribution of mechanism responses. (27 refs.)

73577 The possible elemental nature of brown. K.Fuld, J.S.Werner, B.R.Wooten (Neurologische Universitatsklinik mit Abteilung fur Neurophysiologie, Freiburg, Germany).
Vision Res. (GB), vol.23, no.6, p.631-7 (1983).
The continuous judgmental color-naming technique was used to assess the elemental nature of names descriptive of dark colors. Subjects were instructed to describe the color of a 0.54 deg, 2.5 log td test field of either 450, 530, 580 or 660 nm, that was surrounded by an achromatic annulus of 3.8 deg outer diameter. The annulus was varied in retinal illuminance from 1.5 to 3.7 log td. Test field and annulus were flashed simultaneously for 1 sec to the fovea of one eye. Results from 3 subjects indicated that the names blue, green, red and black were necessary and sufficient for describing the 450, 530 and 660 nm test fields. The 580 nm test field required the color name brown, in addition to the names yellow and black, to describe it when intermediate surround intensities were used. Additional results suggested the possible elemental nature of the color name brown. (21 refs.)

73578 Displacement limits, directional anisotropy and direction versus form discrimination in random-dot cinematograms. J.J.Chang, B.Julesz (Bell Labs., Murray Hill, NJ, USA).
Vision Res. (GB), vol.23, no.6, p.639-46 (1983).
Apparent motion mediated by the short-range process was studied. Random-dot cinematograms were used to determine the maximum displacement (d_{max}) for motion-direction and pattern discrimination. d_{max} is the maximum spatial separation between a correlated region (target) in the two successively presented random-dot images, when observers can correctly identify the direction of motion or the shape of the target. The authors have found that: (1) d_{max} for motion-direction discrimination increases with the square root of the display area; (2) d_{max} is invariant with eccentricities of 4 deg arc; (3) For rectangular targets and brief presentations, d_{max} increases with increases of that target-dimension which is parallel to the orientation of the movement. These findings indicate that short-range movement perception is an orientation specific global process. Furthermore, motion-direction discrimination and pattern discrimination of random-dot cinematograms may be mediated by different levels of processes. However, even for pattern discrimination d_{max} in visual angle increases with increased target area. (12 refs.)

73579 An oblique effect of spatial summation. P.C.Quinn, S.Lehmkuhle (Dept. of Psychology, Brown Univ., Providence, RI, USA).
Vision Res. (GB), vol.23, no.6, p.655-8 (1983).
Contrast thresholds for sinewave gratings were measured as a function of the number of cycles in the grating for two different orientations and three spatial frequencies. At high spatial frequencies, where an oblique effect of contrast sensitivity was demonstrated, there was a greater increase in contrast sensitivity as a function of the number of cycles for the vertical gratings than for oblique gratings. At a lower spatial frequency, where the contrast sensitivity anisotropy was greatly diminished, both orientations displayed a similar increase in contrast sensitivity when the number of cycles in the grating was increased. (23 refs.)

73580 The induced effect: a reply to the arguments of Mayhew and Frisby. A.Arditi (Dept. of Psychology, New York Univ., New York, NY, USA), L.Kaufman, J.A.Movshon.
Vision Res. (GB), vol.23, no.6, p.665-8 (1983).
In ibid., vol.22, p.1225-8, (1982) Mayhew and Frisby raised a number of questions concerning the authors' recently presented theory of the induced size effect (see Arditi et al., ibid. vol.21, p.755-64, 1981). The authors feel that Mayhew and Frisby have correctly pointed out some errors in the authors' original exposition of their theory. The authors feel however that Mayhew and Frisby are incorrect when they say that their objections are insuperable. (5 refs.)

87.34 AUDITION

73581 Perceptibility of pitch changes in a tonal signal emitted by a moving source. U.Jorasz (Dept. of Acoustics, Adam Mickiewicz Univ., Poznan, Poland).
Arch. Acoust. (Poland), vol.7, no.1, p.3-11 (1982).
The starting point for the experimental research was a psychoacoustic analysis of the Doppler effect. The investigations were performed under laboratory conditions using an electronic model of a moving source. Data were obtained on the relationship between the sensations of pitch and loudness of a tonal signal under dynamic conditions. (5 refs.)

73582 Middle-latency auditory evoked responses during open-heart surgery with hypothermia. P.Kileny, D.Dobson, E.T.Gelfand (Univ. of Alberta Hospital, Edmonton, Alberta, Canada).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.3, p.268-76 (March 1983).
Middle-latency auditory evoked responses (MLRs) were recorded from infants and adults before and during open heart surgery. Hypothermia was induced through perfusion cooling by cardiopulmonary bypass. In infants deep hypothermia (to 15°C nasopharyngeal temp.) was often followed by the induction of total circulatory arrest. In adults nasopharyngeal temperatures of 25°C were reached. The MLRs were elicited by unfiltered clicks presented through an insert type earphone and recorded with a vertex to ipsilateral earlobe electrode configuration. The MLRs proved to be resistant to muscle relaxation induced by pancuronium and to anesthesia induced and maintained in most cases by fentanyl. In most cases MLR peak latencies were progressively delayed as temperature decreased. Hypotension resulted in decreased MLR (Pa) amplitude. (29 refs.)

73583 Exponential electrophysiological aging: P3 latency. W.S.Brown (Dept. of Psychiatry & Biobehavioral Sci., Univ. of California School of Medicine, Los Angeles, CA, USA), J.T.Marsh, A.LaRue.
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.3, p.277-85 (March 1983).
Forty-nine normal volunteer subjects ranging in age from 15 to 80 years were studied in an 'auditory oddball' event-related potential paradigm. In certain respects the authors' results replicate other studies, finding significant correlations between age and both N2 and P3 latency. Slopes of the linear age/ERP latency regression function increased with component number (i.e., N1<P2<N2<P3). Further analysis disclosed that the age/ERP component latency relationship is non-linear. Separate age/ERP component latency linear regression functions were computed for subjects 15-45 and 46-80. None of these functions were significant for subjects under 45. Age/latency slopes

were significant in the older group for P2, N2 and P3. The age/P3 latency slope for the subjects under 45 was 0.53 msec/year, versus 3.14 msec/year for the subjects over 45. The data for P3 latency and age are best fitted with a curvilinear first and second degree orthogonal polynomial, which describes a positively accelerating latency increase with age. Clinical implications of the form of the age/P3 latency regression function (curvilinear vs. linear) are discussed. (26 refs.)

73584 **Brain stem auditory evoked potentials: reduction of evaluation errors.** K.Ya.Ogleznev, A.A.Zaretsky, S.A.Shesterikov (Dept. of Neurosurgery, Central Inst. of Advanced Medical Studying, Moscow, USSR).

Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.3, p.331-2 (March 1983).

The commonly used method of brain stem auditory evoked response evaluation is measuring the latency to the extreme points of the components. Because of the influence of noise it is sometimes impossible to determine precisely the true top of the peak. It is possible to avoid this defect by estimating the latency to the middle of the peak front. In this research for both methods of evaluation were calculated for all interpeak intervals. According to the obtained data the use of the middle of the front of the peak for the latency evaluation gave a 24% reduction in the standard deviations. (no refs.)

73585 **Frequency-domain investigations of cochlear stability in the presence of active elements.** S.Koshigoe, A.Tubis (Dept. of Phys., Purdue Univ., West Lafayette, IN, USA).

J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1244-8 (April 1983).

For a linear, time-invariant cochlear response function, the requirements of causality and stability imply the absence of poles of the spectral response function $g(\omega)$ for $\mathrm{Im}\ \omega>0$, with $e^{-i\omega t}$ as the time-dependence factor. The existence of such poles invalidate conventional Hilbert transform (dispersion) relations. The testing of these dispersion relations provides a frequency-domain check of system stability for cochlear models which contain active elements such as negative resistance. The stability of several one- and two-dimensional cochlear models with active elements is checked using these dispersion relations. A simple circuit analog of the cochlea, which contains active elements, is used to illustrate the relationship between the pole locations of $g(\omega)$ and the strength of active elements. (30 refs.)

73586 **Further studies of auditory profile analysis.** D.M.Green, G.Kidd,Jr. (Lab. of Psychophys., Harvard Univ., Cambridge, MA, USA).

J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1260-5 (April 1983).

The discrimination of a change in the intensity of a component or components of a multitone complex is reported as a function of a number of experimental variables. In one experiment, changes in the shape of the spectrum were explored to determine which kinds of changes are more easily detected. Although different signal spectra produced different thresholds, the change in a single component produced the lowest threshold on an energy basis. Various binaural conditions were tested to determine if the shape or profile of the stimulus could be supplied by the ear opposite the one in which the signal was presented. Conditions where spectral contrasts were available to both ears simultaneously (diotic conditions) were much more sensitive than conditions where the spectral contrasts occurred for opposite ears (dichotic conditions). Finally, the level of the component at the signal frequency was varied relative to the other, equal amplitude, components to form a 'pedestal' upon which the signal was added. Detection of the signal was roughly the same for pedestal levels within about ±12 dB of the background except for conditions where masking was apparent. (10 refs.)

73587 **A central spectrum model: a synthesis of auditory-nerve timing and place cues in monaural communication of frequency spectrum.** P.Srulovicz (Dept. of Biomedical Engng., Johns Hopkins Univ. School of Medicine, Baltimore, MD, USA), J.L.Goldstein.

J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1266-73 (April 1983).

A probabilistic psychophysical model for monaural communication from the auditory nerve to the brain is given in the form of a tonotopic display of stimulus spectrum, termed central spectrum. The model builds upon prior research demonstrating the potential of neural timing cues from the auditory nerve for conveying information on complex spectra, and was designed to meet the quantified demands of the psychophysics of frequency measurement. The central spectrum magnitude at each frequency is determined by the response of the auditory-nerve fiber with characteristic frequency matching that frequency. An interval histogram from each fiber is passed through a filter matched to the characteristic frequency of the fiber. This output versus characteristic frequency defines the central spectrum. Detailed analysis demonstrates that efficient probabilistic processing of the central spectrum describes known psychophysical properties of frequency measurement in discrimination and periodicity pitch experiments. Psychophysical models based upon the central spectrum model followed by optimum probabilistic pattern recognition are potentially relevant for predicting human communication limits in response to arbitrary sounds of speech and music. (42 refs.)

73588 **The ear effect as a function of age and hearing loss.** D.Y.Chung, K.Mason, R.P.Gannon, G.N.Wilson (Workers' Compensation Board of British Columbia, Richmond, British Columbia, Canada).

J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1277-82 (April 1983).

Many studies have shown that the right ear statistically is slightly more sensitive than the left ear, particularly in the male adult population. In this study, the authors examined the lateral difference in hearing sensitivity, termed the ear effect here, in an industrial noise-exposed, nonshooting population, by sex, age, and hearing level. It was found that the male population had a larger ear effect (right ear being more sensitive) than the female population. The magnitude of the ear effect was found to be significantly related to the hearing threshold level. The ear effect was highest when the threshold was between 30- and 40-dB HL. Several possible causes for the ear effect are discussed. (11 refs.)

73589 **Intensity discrimination with cochlear implants.** B.E.Pfingst, P.A.Burnett, D.Sutton (Dept. of Otolaryngology & Regional Primate Res. Center, Univ. of Washington, Seattle, WA, USA).

J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1283-92 (April 1983).

Intensity difference limens were measured for various frequencies and intensities of sinusoidal and pulsatile electrical stimulation in monkeys with electrodes implanted in the scala tympani, scala vestibuli, modiolus, or middle ear. Difference limens decreased, as a function of initial stimulus intensity, from values of 1.5-3 dB near threshold to as low as 0.5 dB near the upper limit of the dynamic range. If sensation level was held constant, difference limens decreased as a function of frequency up to about 500 Hz, and then remained constant. They were similar across a variety of electrode placements and separations if differences in threshold and dynamic range were taken into account. However, difference limens measured in severely damaged ears were slightly smaller than those in moderately damaged ears. The near miss to Weber's law, characteristic of acoustic difference limens, was not seen with electrical stimuli. Difference limens for electrical stimuli were roughly one-half those for acoustic stimuli; thus, part of the deficit in dynamic range for electrical stimulation compared with acoustic stimulation is countered by the smaller intensity difference limens for electrical stimuli. (33 refs.)

73590 **On the undamped natural frequencies and mode shapes of a finite-element model of the cat eardrum.** W.Robert, J.Funnell (Dept. of Otolaryngology, McGill Univ., Montreal, Quebec, Canada).

J. Acoust. Soc. Am. (USA), vol.73, no.5, p.16578-61 (May 1983).

This paper presents a three-dimensional finite-element model of the cat eardrum which includes inertial effects. The model is implemented using a hierarchical modeling scheme which permits the mesh resolution to be varied. The static behavior of the model is calculated as a function of mesh resolution in order to check the validity of an earlier model. The first six undamped natural frequencies, and the corresponding modal vibration patterns, are then calculated. They are found to lie between about 1.8 and 3.2 kHz for the standard values chosen for the model parameters. The effects on the natural frequencies of varying seven parameters of the model are described. (8 refs.)

73591 **The temperature dependency of neural and hair cell responses evoked by high frequencies.** M.C.Brown, D.I.Smith, A.L.Nuttall (Kresge Hearing Res. Inst., Univ. of Michigan Medical School, Ann Arbor, MI, USA).

J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1662-9 (May 1983).

A fine thermocouple, placed on the round window of the guinea pig cochlea, was used to measure temperature and electrical potentials. In acute experiments, rectal temperature was held constant at 38°C while cochlear temperature was varied between 38°C and 31.5°C. Cochlear cooling to 36°C caused elevated thresholds for the compound action potential (CAP) in response to tone bursts with frequencies above 24 kHz. CAP latencies increased for all frequencies tested (2 to 40 kHz). Cooling to lower temperatures produced larger latency increases and greater threshold shifts which extended to CAPs evoked by frequencies as low as 16 kHz. These CAP changes were fully reversible after a cochlear temperature of 38°C was restored. In an attempt to create more uniform cooling of the cochlea, experiments were also conducted with round window thermocouples chronically implanted in guinea pigs. After cooling the entire anesthetized animal to 36°C, CAP thresholds were again elevated only for frequencies above 24 kHz. In other acute experiments, extracellular DC receptor potentials were recorded from the organ of Corti with micropipettes. Cooling caused a decreased sensitivity to tones at the characteristic frequency of the recording location (20 kHz) and had less effect on responses to lower frequencies. The receptor potential usually recovered after rewarming the cochlea. These data emphasize that temperature is an important parameter when electrophysiological measurements are being made. They also suggest an explanation for the reported discrepancy between behavioral and electrophysiological thresholds at high frequencies. (38 refs.)

73592 **Comparison of click responses of primary auditory fibers with minimum-phase predictions.** C.D.Geisler, D.G.Sinex (Dept. of Neurophysiology, Univ. of Wisconsin, Madison, WI, USA).

J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1671-6 (May 1983).

Minimum-phase impulse responses were constructed from the frequency threshold-response curves of primary auditory fibers in the anesthetized cat. These impulse responses had many of the same characteristics as the experimental click responses. The two types of responses had similar interpeak intervals as well as similar (±1.5 ms) latencies to the principal mode and similar (±1.0 ms) intervals from response onset to the principal mode. (20 refs.)

73593 **Target detection in reverberation by an echolocating Atlantic bottlenose dolphin (Tursiops truncatus).** W.W.L.Au, C.W.Turl (Naval Ocean Systems Center, Kailua, HI, USA).

J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1676-81 (May 1983).

An experiment was conducted to determine the ability of an echolocating Atalantic bottlenose dolphin (Tursiops truncatus) to detect targets in the presence of reverberation. Reverberation was induced by a clutter screen consisting of forty-eight 5.1-cm-diam cork spheres spaced 15.2 cm apart and arranged in a rectangular array, located behind the targets. Hollow aluminium cylinders having the same outer diameter and wall thickness and three different lengths were used as targets. The dolphin was trained to station in a hoop, 6 m from the targets, and to echolocate the target upon the reception of an audio cue. Only one of the targets would be presented in a target-present trial. Data were collected on the animal's detection of performance as a function of the separation distance between the clutter screen and the targets. The animal's performance for the smallest cylinder varied from 91% to 55% correct as the separation distance decreased from 10.2 to 0 cm. The target strength of the clutter screen and the cylinders were measured both in terms of the energies and the maximum peak-to-peak amplitudes of the incident and reflected echoes. These measurements indicated that when the target-clutter screen separation distances was 0 cm, the dolphin's 50% correct detection occurred at an energy echo-to-reverberation ratio of approximately 0.25 dB and at a peak-to-peak echo-to-reverberation ratio of 2.6 dB. The results also indicated that the dolphin's pulse emissions were monitored by a microprocessor system and the results are presented in terms of the average number of clicks and the average response latency, as a function of the separation distance. (18 refs.)

73594 **Forward masking patterns for harmonic complex tones.** B.C.J.Moore, B.R.Glasberg (Dept. of Experimental Psychology, Univ. of Cambridge, Cambridge, England).

J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1682-5 (May 1983).

Complex tones containing the first ten harmonics at equal amplitude, and with fundamental frequencies of 100, 200, or 400 Hz, served as maskers for brief sinusoidal signals (10-, 20-, or 40-ms duration) presented immediately following the maskers. Threshold was measured as a function of signal frequency, using an adaptive, two-alternative forced-choice procedure. The starting phase of the signal relative to the masker had no significant effect on threshold. The masking patterns showed clear peaks corresponding to the first 3 or 4 harmonics, but no peaks were visible for higher harmonics. It is concluded that the 'ripple' in the internal spectra of the maskers amounts to 3 dB or less for harmonics above the fifth. (14 refs.)

73595 **The origin of tonality and a possible explanation of the octave enlargement phenomenon.** K.Ohgushi (NHK Broadcasting Sci. Res. Lab., Tokyo, Japan).

J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1694-700 (May 1983).

It is known that the subjective octave is slightly larger than the physical octave (=2) for a variety of tones. This paper presents a new idea about the physiological origin of totality, and a new theory founded on recent knowledge of the auditory physiology, to explain the octave enlargement phenomenon for pure tones. The theory's predictions of the subjective octave agree well with psychophysical data. (36 refs.)

73596 **Pitch of narrow-band signals.** L.J.Stover, L.L.Feth (Audiology & Speech Sci., Purdue Univ., West Lafayette, IN, USA).

J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1701-7 (May 1983).

This study investigated the pitch elicited by complex narrow bandwidth signals. These signals ranged from two-component tones to multiple-component approximations of narrow-band noise. All were contained with 10-, 20-, or 50-Hz bandwidths. Listeners were asked to adjust the frequency of a pure tone to match the pitch they heard in a given complex signal. A simple model suggests that the pitch of these complex signals should match that a pure tone set to the center frequency. For a majority of the signals, the performance of three of four listeners were not different from the model predictions. However, the two-component signals were apparently resolved and two simultaneous pitches were heard by some listeners. The fourth listener heard two sequential pitches in many of the complex signals. The authors are unable to account for the performance although the pitch matches were very repeatable. These results have implications for an understanding of pitch coding and auditory spectral resolution. (17 refs.)

73597 Detection of interaural differences of intensity in trains of high-frequency clicks as a function of interclick interval and number. E.R.Hafter, R.H.Dye,Jr., E.Wenzel (Dept. of Psychology, Univ. of California, Berkeley, CA, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1708-13 (May 1983).
Listeners were asked to detect interaural differences of intensity in trains of 4000-Hz clicks as the interclick interval (ICI) was varied from 10 to 1 ms and the number of clicks in a train (*n*) was varied from 1 to 32. As has previously been shown for differences of time [Hafter and Dye, ibid., vol. p.72, 6440-651, 1983], plots of log interaural thresholds versus log *n* produced slopes that decrease with ICI. These results are explained in terms of a saturation model which argues that as the click rate increases, the evoked neural activity changes from what is essentially a tonic response toward one that is more plastic. (33 refs.)

73598 Interaural time and amplitude discrimination in noise. R.M.Stern,Jr., J.E.Slocum, M.S.Phillips (Dept. of Electrical Engng., Carnegie-Mellon Univ., Pittsburgh, PA, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1714-22 (May 1983).
Just-noticeable differences (JNDS) of both interaural time delay (ITD) and interaural intensity difference (IID) were measured for binaural tones in the presence of broadband maskers. The tones were presented at 50 dB SPL, the target frequency was 500 Hz, and the masker frequency was 100-1000 Hz, with various combinations of ITD and IID. The time and amplitude JNDs exhibit similar dependencies on target-to-masker ratio and masker type. At a given target-to-masker ratio, discrimination was generally best in the presence of diotic maskers and worst in the presence of the interaurally out-of-phase maskers. Results for the other masker types examined tended to fall in between these two extremes. Many of these data trends are consistent with predictions of the lateralization model and the position-variable model based on auditory-nerve activity. (40 refs.)

73599 Traffic noise annoyance and noise sensitivity in persons with normal and impaired hearing. G.Aniansson, K.Pettersson, Y.Peterson (ENT Dept., Univ. of Goteborg, Goteborg, Sweden).
J. Sound & Vib. (GB), vol.88, no.1, p.85-97 (8 May 1983).
A laboratory study was undertaken to investigate annoyance caused by traffic noise among persons with normal hearing and impaired hearing. The impaired hearing groups are representative of about 10% of the population in Sweden with similar or poorer hearing acuity. Groups with different hearing ability were exposed to 45 dB(A) and 55 dB(A) traffic noise when engaged in four activities, in which noise did or did not interfere with speech. The annoyance ratings were higher for the impaired hearing groups at 45 dB(A) with 55 dB(A) in the activities in which noise did interfere with speech. The greatest differences were found between men with noise-induced hearing loss and men with normal hearing. The results revealed a higher sensitivity to noise in one of the noise-induced hearing loss groups compared with men with normal hearing as well as in females compared with males in groups with and without hearing impairment. Changes in mood after a 2 h exposure to 45 dB(A) and 55 dB(a) traffic noise were also found. Pleasantness and activation decreased after exposure when all subjects were taken as one sample. (29 refs.)

73600 Traffic noise annoyance and speech intelligibility in persons with normal and persons with impaired hearing. G.Aniansson (ENT Dept., Univ. of Goteborg, Goteborg, Sweden), M.Bjorkman.
J. Sound & Vib. (GB), vol.88, no.1, p.99-106 (8 May 1983).
Annoyance ratings in speech intelligibility tests at 45 dB(A) and 55 dB(A) traffic noise were investigated in a laboratory study. Subjects were chosen according to their hearing acuity to be representative of 70-year-old men and women, and of noise-induced hearing losses typical for a great number of industrial workers. These groups were compared with normal hearing subjects of the same sex and, when possible, the same age. The subjects rated their annoyance on an open 100 mm scale. Significant correlations were found between annoyance expressed in millimetres and speech intelligibility in percent when all subjects were taken as one sample. Speech intelligibility was also calculated from physical measurements of speech and noise by using the articulation index method. Observed and calculated speech intelligibility scores are compared and discussed. Also treated is the estimation of annoyance by traffic noise at moderate noise levels via speech intelligibility scores. (20 refs.)

73601 A quasi-3D model of the spirally coiled cochlea. C.H.Loh (Dept. of Theoretical & Appl. Mech., Auckland Univ., Auckland, New Zealand).
Mech. Res. Commun. (GB), vol.10, no.1, p.15-19 (Jan.-Feb. 1983).
The cochlea is the innermost organ of the peripheral auditory system. It is a spirally-coiled cavity filled with an incompressible fluid with a mechanical piston (stapes) located at one end. The cavity consists of two chambers separated by a partition, a portion of which is flexible and the remainder rigid. The flexible portion, named the basilar membrane (BM), is a shell of increasing width and decreasing elastic stiffness. Its deflection is controlled by the pressure difference across the partition. Present models of the cochlea do not include the spiral coiling. The present analysis includes the curvature and attempts to solve the commitant equations using a quasi-3D version of the WKB method. (2 refs.)

73602 Cochlear effects of cryosurgery. M.Suzuki (Dept. of Otolaryngology, Hiroshima Univ., Hiroshima, Japan), I.M.Hunter-Duvar.
Scanning Electron Microsc. (USA), pt.3, p.1295-300 (1982).
A total of 21 cochleas in 13 chinchillas were treated with cryosurgery and the damage to the organ of Corti was evaluated with the scanning electron microscope. The apical half-turn was treated in 11 of the cochleas and the basal half-turn in 10. Apical exposure to the cryoprobe generally resulted in severe damage to sensory cells in the apical turn whereas basal turn exposure generally resulted in mild damage to sensory cells in the basal turn. On occasion severe damage from apical turn exposure resulted in severe damage that extended to the basal turn. First row outer hair cells were the most susceptible to damage and inner hair cells least susceptible. (9 refs.)

73603 Comparative morphological features of the caecilian inner ear with comments on the evolution of amphibian auditory structures. J.S.White, I.L.Baird (Dept. of Anatomy, Creighton Univ. School of Medicine, Omaha, NE, USA).
Scanning Electron Microsc. (USA), pt.3, p.1301-12 (1982).
Comparative fine structural studies of amphibian auditory structures in urodeles have been extended to include examination of the papilliform endorgans (amphibian, neglecta and basilar) that variably occur in species selected from three families of caecilians (Gymnophiona). The species investigated were Ichthyophis kohtaoensis (Ichthyophiidae), Dermophis mexicanus (Caeciliidae) and Typhlonectes natans (Typhlonectidae). Ichthyophis is the only form to display all three papillae; both Dermophis and Typhlonectes lack a basilar papilla but all three species show both neglecta and amphibiorum. In these forms, the amphibian papilla contained the most sensory cells with ciliary bundles organized into two proximal and distal groups polarized toward a mid-line papillar axis. The papilla neglecta contained slightly fewer sensory cells and ciliary bundles oriented predominantly posteriorly. In Ichthyophis, the basilar papilla contained the lowest sensory cell counts of any papilla. (38 refs.)

73604 Relationships between vocal intensity and noninvasively obtained aerodynamic parameters in normal subjects. S.Tanaka, W.J.Gould (Vocal Dynamics Lab., Lenox Hill Hospital, New York, NY, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1316-21 (April 1983).
The relationships between vocal intensity (sound pressure level) and intrapulmonic pressure, mean flow rate, and aerodynamic power were investigated in ten normal subjects. The intrapulmonic pressure was measured noninvasively and simultaneously with sound pressure level and mean flow rate during sustained phonation of the vowel /a/ by means of plethysmographic and pneumotachographic methods. The aerodynamic power was calculated as intrapulmonic pressure times mean flow rate. The averaged values for the normal subjects represented $(\text{sound power}) \propto (\text{intrapulmonic pressure})^{3.18}$, $(\text{sound power}) \propto (\text{mean flow rate})^{9.62}$, and $(\text{sound power}) \propto (\text{aerodynamic power})^{2.44}$, where sound power at the open end of the pneumotachograph was estimated from sound pressure level. Vocal efficiency was defined as the ratio of sound power to aerodynamic power. Individual variation of vocal efficiency (in dB) was satisfactorily small in the normal subjects, and was determined by the simple addition of individual variations of intrapulmonic pressure and mean flow rate (in dB) from the average values. These findings strongly suggested that the comparison of those measurements against normative data for normal subjects such as provided by this study is useful in evaluating and clarifying the ineffective voice production of the pathological larynx. (17 refs.)

73605 Enlargement of the supraglottal cavity and its relation to stop consonant voicing. J.R.Westbury (Dental Res. Center, Univ. of North Carolina, Chapel Hill, NC, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1322-36 (April 1983).
Measurements were made of sagittal plane movements of the larynx, soft palate, and portions of the tongue from a high-speed cinefluorographic film of utterances produced by one adult male speaker of American English. These measures were then used to approximate the temporal variations in supraglottal cavity volume during the closures of voiced and voiceless stop consonants. All data were subsequently related to a synchronous acoustic recording of the utterances. Instances of /p,t,k/ were always accompanied by silent closures, and sometimes accompanied by decreases in supraglottal volume. In contrast, instances of /b,d,g/ were always accompanied both by significant intervals of vocal fold vibration during closure, and relatively large increases in supraglottal volume. However, the magnitudes of volume increments during the voiced stops, and the means by which those increments were achieved, differed considerably across place of articulation and phonetic environment. These results are discussed in the context of a well-known model of the breath-stream control mechanism, and their relevance for a general theory of speech motor control is considered. (41 refs.)

73606 Acoustic and perceptual indicators of emotional stress. L.A.Streeter (Crawford Hill Lab., Bell Labs., Holmdel, NJ, USA), N.H.Macdonald, W.Apple, R.M.Krauss, K.M.Galotti.
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1354-60 (April 1983).
Tape recordings of telephone conversations of Consolidated Edison's system operator (SO) and his immediate superior (CSO), beginning an hour before the 1977 New York Blackout, were analyzed for indications of psychological stress. (SO was responsible for monitoring and switching power loads within the Con Ed network.) Utterances from the two individuals were analyzed to yield several pitch and amplitude statistics. To assess the perceptual correlates of stress, four groups of listeners used a seven-point scale to rate the stress of SO and CSO from either randomized vocal utterances or transcripts of the randomized utterances. Results indicated that whereas CSO's vocal pitch increased significantly with increased situational stress, SO's pitch decreased. Listener ratings of stress from the voice were positively related to average pitch. It appears that listeners' stereotype of psychological stress includes elevated pitch and amplitude levels, as well as their increased variability. (15 refs.)

73608 Spinal and early scalp-recorded components of the somatosensory evoked potential following stimulation of the posterior tibial nerve. M.Seyal, R.G.Emerson, T.A.Pedley (Neurological Inst., Columbia Univ. Coll. of Physicians & Surgeons, New York, NY, USA).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.3, p.320-30 (March 1983).
Somatosensory evoked potentials (SEPs) were elicited by stimulation of the posterior tibial nerve (PTN) in 12 normal adults. Recording using both cephalic and non-cephalic references were obtained from multiple electrodes placed over the spine and scalp. Following PTN stimulation, the fastest recorded potentials of the afferent sensory volley proceeds up the spinal cord at constant velocity. After arrival of the volley at cervical cord levels, 3 widely distributed waves, P_{28}, P_{31} and N_{34}, are recorded from scalp electrodes. These 'far-field' potentials are followed by a localized positivity (P_{38}) which has a peak voltage either at the vertex or just laterally toward the side of stimulation. A contralateral negativity (N_{38}) was present in most individuals. It is proposed that P_{28} arises from medial lemniscus; that P_{31} is generated by ventrobasal thalamus; and that N_{34} is probably the result of further activity in thalamus and/or thalamocortical radiations. (27 refs.)

73609 Vibrotactile masking of Pacinian and non-Pacinian channels. R.D.Hamer, R.T.Verrillo, J.J.Zwislocki (Inst. for Sensory Res., Syracuse Univ., Syracuse, NY, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1293-303 (April 1983).
Vibrotactile masking functions were determined using sinusoidal and noise maskers. Results were nearly identical within the Pacinian (P) and non-Pacinian (NP) channels. At low masker SLs there was a substantial amount of negative masking which proved not to be an artifact of stimulus definition. The critical parameters for successful prediction of the data were a peripheral threshold and internal Gaussian noise. Threshold shifts in cross-channel stimulation can be attributed to the masker exceeding the detection threshold of the signal channel. (51 refs.)

73610 An analysis of the stress field of human knee joint. Wu Wen-zhou, Sun Jue (Taiyuan Polytech. Inst., China).
Acta Mech. Solida Sin. (China), no.3, p.296-301 (1981). In Chinese.
A two-dimensional built-up structure model consisting of plates of different material constants is developed for the human knee. The finite element method is adopted to analyse the stress field. The results obtained are: a) for the tibial plateau, both the maximum compressive and maximum shear stress are on the lateral plateau; b) the surface load on the subchondral bone of femur is transmitted almost directly to the subchondral bone of tibia; c) the stress distribution in the articular cartilage is uniform; d) the effect of the lubricant liquid is not taken account of, but the results obtained show that there is practically no shear stress on the tibio-femoral contact surface. (7 refs.)

73611 Relation between lung mechanics, hemodynamics and regional distribution of blood flow and ventilation in left to right intracardiac shunt. P.Zardini, C.Bucca, G.Rolla (Univ. di Torino, Turin, Italy).
J. Nucl. Med. & Allied Sci. (Italy), vol.27, no.1, p.1-8 (Jan.-March 1983).
14 patients with congenital left to right intracardiac shunt were investigated by the ^{133}Xe technique. The patients were without any other cardiac or pulmonary disease which could affect the pathophysiologic conditions of their central circulation. From the results obtained, it appears that pulmonary hyperfusion alone produces an early closure of small airways and a rather variable pattern of distribution of intrapulmonary blood flow, while when it is complicated by pulmonary hypertension, it impairs lung compliance and small airway caliber and causes a diversion of blood flow toward the apex of the lung. (22 refs.)

73612 Flow visualization in isolated transparent natural blood vessels. T.Karino, M.Motomiya (McGill Univ. Medical Clinic, Montreal General Hospital, Montreal, Quebec, Canada).
Biorheology (GB), vol.20, no.2, p.119-27 (1983).
A novel technique to prepare isolated transparent natural blood vessels was developed and used to study the detailed flow patterns in some regions of the circulation. It was found that paired spiral secondary flows and recirculation zones form downstream of venous valves, at the arterial T-junctions in the dog abdominal aorta, and in the human carotid sinus over a wide range of geometrical and flow conditions, including the time-averaged mean values of the physiological flow rates. (17 refs.)

73613 A theoretical analysis of the effects of varying fibrinogen concentration and haematocrit on the flow characteristics of blood in cylindrical tubes. M.W.Rampling, T.Challoner (Dept. of Biophysics & Neurology, St. Mary's Hospital Medical School, London, England).
Biorheology (GB), vol.20, no.2, p.141-52 (1983).
The viscosity/shear rate relationship of whole blood is shown to be described to a good approximation by a bilinear plot on log/log axes. This has allowed an analytical solution to be obtained which gives a full description of the flow properties of blood in rigid tubes of a size where the Fahraeus-Lindqvist effect is minimal. As a result the profound effects that changing haematocrit has on blood flow in such tubes can be quantitated. The analysis also shows that in similar circumstances altering fibrinogen concentration is of rheological significance only at flow rates below the normal physiological range. (13 refs.)

73614 Peristaltic transport of a physiological fluid. I. Flow in non-uniform geometry. L.M.Srivastava (Dept. of Maths., Univ. of Liberia, Monrovia, Liberia), V.P.Srivastava, S.N.Sinha.
Biorheology (GB), vol.20, no.2, p.153-66 (1983).
The problem of peristaltic transport of a fluid of variable viscosity in a non-uniform tube and channel has been investigated under zero Reynolds number conditions, and in the long wavelength approximation. It is found that the pressure decrease as the fluid viscosity decreases at zero flow rate is independent of viscosity variation at a certain value of flow rate. The pressure increases if the flow rate increases from this value. The difference between two corresponding values (for constant and variable viscosity) of pressure rise, under a given set of conditions, increases with increasing amplitude ratio at zero flow rate. Further, for a given zero pressure rise, the flow rate increases as the viscosity of the fluid decreases. The pressure rise, in the case of non-uniform geometry, is found to be much smaller than the corresponding value in the case of uniform geometry. (54 refs.)

73615 Peristaltic transport of a physiological fluid. II. Flow in uniform geometry. L.M.Srivastava (Dept. of Maths., Univ. of Liberia, Monrovia, Liberia), V.P.Srivastava, S.N.Sinha.
Biorheology (GB), vol.20, no.2, p.167-78 (1983).
For pt.I see ibid., vol.20, no.2, p.153-66, 1983. Using the model of peristaltic flow in non-uniform geometry, developed in pt.I, results for uniform tube and channel are obtained in closed form. Comparison of analysis with other theories and the effect of viscosity variation are discussed in detail. Finally, quantitative comparisons are made between theory and experiments of Weinberg et al. (1971) and Latham (1966). (11 refs.)

73616 Peristaltic transport of a physiological fluid. III. Applications. L.M.Srivastava (Dept. of Maths., Univ. of Liberia, Monrovia, Liberia), V.P.Srivastava, S.N.Sinha.
Biorheology (GB), vol.20, no.2, p.179-86 (1983).
For pt.II see ibid., vol.20, no.2, p.167-78, 1983. The models of peristaltic flow in non-uniform and uniform tube and channel, developed in pts.I and II are applied and compared with the observed flow rates in the vas deferens of rhesus monkeys, the small intestine, and the ductus efferentes of the male reproductive tract. (23 refs.)

73617 Development of a rheological constitutive relation for a soft biological tissue. M.G.Sharma, S.Rafie (Pennsylvania State Univ., University Park, PA, USA).
Biorheology (GB), vol.20, no.2, p.187-97 (1983).
A rheological constitutive relation in shear for an apple cortex tissue has been developed based upon creep experiments on solid cylindrical samples of the soft tissue obtained from a specified location of the apple and subjected to constant torques of various magnitudes and duration using a specially developed multiaxial loading device. Results indicate that the material displays nonlinear viscoelastic properties which can be characterized by a multiple integral relation between the torque and the unit angle of twist. Using this relation the creep response of the material under two step and three step torque histories and the history with torque linearly varying with time was predicted and found to agree well with experimental results. A method is described for obtaining the constitutive relation in shear from the developed unit angle of twist-torque equation. The shear constitutive relation for the tissue has been found to be of the integral type with two kernal functions specifying the rheological response. (13 refs.)

73618 Biorheological matching: mucociliary interaction and epithelial clearance. A.Silberberg (Polymer Res. Dept., Weizmann Inst. of Sci., Rehovot, Israel).
Biorheology (GB), vol.20, no.2, p.215-22 (1983). (Proceedings of the Fourth International Congress of Biorheology, Tokyo, Japan, 27 July-1 Aug. 1981).
In mucociliary clearance mucus has been found to be essential as coupler between ciliary beat and transport. The rheological properties of mucus are carefully matched to this task. It has to be an incipient gel and deviations from this state to a sol or to a stiff gel both render it defective in function. The known rheological properties of normal mucus are shown to be consistent with one's understanding of how a periodically interacting set of cilia produce mucus layer flow. A dual requirement has to be met: adequate tip penetration and adequae force transfer laterally. As a result any biorheologically properly matched system can replace mucus. Mucociliary clearance is a clear cut, rather well understood case of a general principle of biorheological matching. (5 refs.)

73619 Frequency distribution of viscoelastic properties of sputum studied by the raised cosine pulse method: the effects of mucolytic agents. T.Okubo, S.Shimura, T.Takishima (First Dept. of Internal Medicine, Tohoku Univ. School of Medicine, Sendai, Japan), Y.Otubo, K.Umeya.
Biorheology (GB), vol.20, no.2, p.231-8 (1983). (Proceedings of the Fourth International Congress of Biorheology, Tokyo, Japan, 27 July-1 Aug. 1981).
Reports studies on the frequency dependence of the viscoelastic behavior of human sputum using the authors' newly developed raised cosine pulse (RCP) method. This method needs only 1.5 ml sputum, and allows one to estimate the responses of storage modulus (G′) and loss modulus (G″) to the change of angular frequency $\omega=10^{-3}$-10^{0} rad. sec^{-1} in only 2-3 minutes by applying one small pulse strain. Measurements were made at 37°C and within 2 hours of expulsion. The results obtained by the RCP method and by a conventional method were compared and were roughly in agreement. From the behavior of G′ and G″, the presence of a relaxation region at $\omega=3\times10^{-2}$-3×10^{-1} rad. sec^{-1} could be deduced. The magnitude of relaxation increased and relaxation frequencies decreased, as the purulence of sputum increased. The authors also observed differences in viscoelastic behavior of sputum resulting from the application of mucolytic agents in vivo, which suggest corresponding changes of mechanical structures to the different pharmacological actions of these drugs. (10 refs.)

73620 Spinability of bronchial mucus. Relationship with viscoelasticity and mucous transport properties. E.Puchelle, J.M.Zahm, C.Duvivier (Unite de Physiopathologie Respiratoire, INSERM, Vandoeuvre-les-Nancy, France).
Biorheology (GB), vol.20, no.2, p.239-49 (1983). (Proceedings of the Fourth International Congress of Biorheology, Tokyo, Japan, 27 July-1 Aug. 1981).
Spinability of normal mucus and of sputum collected in chronic bronchitic patients was measured using an automatic device derived from that developed by Chretien et al. (1977) for cervical mucus. Spinability of sputum decreased as the purulence increased. Although significant correlations were found between spinability and apparent viscosity ($r=-0.50$, $p<0.05$) or elasticity ($r=0.54$, $p<0.02$), large variations in spinability were observed for sputum samples ranging in a zone of low viscosity and elasticity. Sputum with high spinability exhibited normal transport rate on the depleted frog palate although their viscosity and elasticity were abnormally low. The significant correlation obtained between spinability and sputum transport rate ($r=0.61$, $p<0.01$) suggests that this rheological factor, along with viscosity and elasticity, plays an important role in the mucociliary transport mechanism. (18 refs.)

73621 Mucociliary clearance in chronic sinusitis: related human nasal clearance and in vitro bullfrog palate clearance. Y.Majima, Y.Sakakura, T.Matsubara, S.Murai, Y.Miyoshi (Dept. of Otolaryngology, Mie Univ. School of Medicine, Mie, Japan).
Biorheology (GB), vol.20, no.2, p.251-62 (1983). (Proceedings of the Fourth International Congress of Biorheology, Tokyo, Japan, 27 July-1 Aug. 1981).
Nasal mucociliary clearance was measured in both healthy subjects and in patients with chronic sinusitis using the saccharin granule technique. Nasal mucociliary transit time (ST) was significantly slower in the patients with chronic sinusitis compared with that in controls ($p<0.005$). Nasal mucus collected from each nasal cavity was used for in vitro bullfrog palate clearance studies and compared to the in vivo nasal ST. The mucociliary clearance rate (MTR) on the frog palate was 12.5 ± 2.5 mm/min in the mucus from control subjects, and 6.1 ± 1.5 mm/min in the mucus from the patients. The difference was statistically significant ($p<0.005$). The MTR on the frog palate in the patients whose nasal ST was within the normal range was significantly slower than that in the controls ($p<0.005$), but not significantly different from that in the patients whose nasal ST was over the normal range. These results suggest that the nasal mucous properties which decreased the mucociliary clearance on the frog palate did not contribute to the mucociliary clearance of the patients who had a normal mucociliary clearance. (23 refs.)

73622 The physics of arteriole blood flow. I. General theory. E.A.Trowbridge (Dept. of Appl. & Computational Maths., Univ. of Sheffield, Sheffield, England).
Clin. Phys. & Physiol. Meas. (GB), vol.4, no.2, p.151-75 (May 1983).
A continuum physics theory of arteriole blood flow is presented based on the observed behaviour of blood using high-speed photography. The theory highlights the importance of time scales as well as length scales in constructing a physical theory of blood flow. Arteriole flow viewed at 8000 frames s^{-1} reveals a highly complicated cellular motion; however the same flow viewed at the same spatial magnification by the human sensor, the eye, reveals ony a pinkish column of fluid. The eye 'smoothes out' the microscopic cellular behaviour. This principle is used in the continuum theory, where averages are taken over space and time, to explain how the observed collisions of the erythrocytes with themselves, plasma molecules and the arteriole wall determine blood, mass-averaged velocity profiles and mass flow rates. A new dimensionless similarity parameter arises from the continuum mixture. Its magnitude provides a measure of the relative importance of the viscous drag of a constituent and the frictional force experienced by one constituent due to the presence of another constituent in the mixture during arteriole blood flow. (14 refs.)

73623 The physics of arteriole blood flow. II. Comparison with experiment. E.A.Trowbridge, P.M.Meadowcroft (Dept. of Appl. & Computational Maths., Univ. of Sheffield, Sheffield, England).
Clin. Phys. & Physiol. Meas. (GB), vol.4, no.2, p.177-96 (May 1983).
For pt.I see ibid., vol.4, no.2, p.151-75, 1983. The results of pt.I are used to explain, using a continuum physics approximation, some of the experimentally observed phenomena which appear in the literature. The magnitude of the new dimensionless similarity parameter which arises from the mixture theory indicates that the internal frictional force acting on the plasma due to the presence of the erythrocytes (with an equal and opposite force acting on the erythrocytes due to the plasma) dominates the internal plasma viscous force. It is this feature that produces the observed slower flow rate of blood compared with water for a given pressure gradient. Quantitative predictions, which agree with experiment, of the cell-free layer, feed, dynamic and discharge haematocrits for cylindrical pipe flow are obtained. The observed decrease in apparent blood viscosity with decrease in cylinder diameter is also predicted. Finally an explanation is presented for the experimental observation of an off-centre peak in the tube radial viscosity profile. (21 refs.)

73624 Electromechanical and physicochemical properties of connective tissue. A.J.Grodzinsky (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA).
CRC Crit. Rev. Biomed. Eng. (USA), vol.9, no.2, p.133-99 (1983).
Connective tissues are one of a class of biological materials that exhibit electromechanical transduction behavior. This behavior involves fields that are intrinsic to the ionized macromolecules that make up the material, as well as the interactions between externally applied fields and these ionized macromolecules. Recent interest has focused on the importance of electrical forces to the structure-property-function relationships in normal and diseased connective tissues. In addition, current clinical use of electromagnetic fields to induce growth and remodeling of connective tissues motivates the necessity to understand transduction between electrical, chemical, and mechanical subsystems at the molecular level. After a brief review of the composition and ultrastructure of representative connective tissues, recent research on the macromolecular basis of electromechanical transduction is discussed. The influence of electromechanical forces on transport processes in extracellular matrices is reviewed. Finally, current concepts of the significance of electromechanical transduction in the function of natural tissues and artificial replacement materials are summarized. (260 refs.)

73625 Is bone a Cosserat solid?. H.S.Yoon, J.L.Katz (Dept. of Biomedical Engng., Rensselaer Polytech. Inst., Troy, NY, USA).
J. Mater. Sci. (GB), vol.18, no.5, p.1297-305 (May 1983).
In a viscoelastic composite material including bone, acoustic waves undergo both geometric and viscoelastic dispersions as they propagate through the medium. The viscoelastic dispersion is characterized by an increase in phase velocity with increase in frequency, while the geometric dispersion is well-known. By comparing the dispersion data on these and other types of materials, it has been noted that the increases in the ultrasonic velocities for bones are much larger than those for simple viscoelastic solids and composites, suggesting an additional dispersion mechanism. This additional dispersion can be explained by Mindlin's theory (1963) on the Cosserat continuum with microstructure. (52 refs.)

73626 Correlation between walking energy expenditure and tachographic gait parameters. D.N.Tibarewala, S.Ganguli (Coll. of Medicine, Univ. of Calcutta, Calcutta, India).
J. Med. Eng. & Technol. (GB), vol.7, no.2, p.58-65 (March-April 1983).
A group of 53 adult men, normal subjects as well as victims of different types of lower-extremity handicaps, took part in tachographic gait studies and measurements of physiological energy expenditure whilst walking at a self-selected pace. The observations were analysed to explore the relationships between walking energy expenditure and various gait parameters. This analysis allowed the authors to identify some biomechanical indices which can be used for objective evaluations of human performance in locomotion. (14 refs.)

87.50 BIOLOGICAL EFFECTS OF RADIATIONS

(inc. effects of fields)

73627 Absence of the influence of a magnetic field on Na^+, K^+-dependent ATPase. M.L.Savich, M.V.Shcheglova, L.M.Paikham, A.N.Kuznetsov (Res. Inst. for the Biological Testing of Chem. Compounds, Kupavna, USSR).
Biophysics (GB), vol.27, no.3, p.549-51 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.532-3 (1982).
Previous work has indicated the possibility of a direct action of a magnetic field on Na^+, K^+-ATPase. The authors investigated a membrane preparation of Na^+, K^+-ATPase isolated from the grey matter of bovine brain. Their results indicate that a magnetic field up to 1500 mT does not influence the isolated membrane preparation of Na^+, K^+-ATPase. The effect of a magnetic field on active transport in the tissues previously observed (Bresler et al., 1978, Bresler and Bresler, 1974) is apparently due to the influence of the field not on transport Na^+, K^+-ATPase but on certain regulators of its activity. (8 refs.)

73628 New conclusions on the avoidance of danger from electromagnetic fields in the region of high-power radio transmitters. M.Dahme (Inst. fur Rundfunktech. GmbH, Munchen, Germany).
NTG-Fachber. (Germany), vol.83, p.109-18 (1983). In German. (Horrundfunk 6 (Sound Broadcasting), Mannheim, Germany, 23-25 Nov. 1982).
For the estimation of the immediate danger to persons by electromagnetic fields, two general concepts are applied-for frequencies below 30 kHz danger from the effect of the alternating field on the nerve cells, and for frequencies above 2 MHz danger of damage by heating effects; between 30 kHz and 2 MHz both risks are present. A review is given of present knowledge of the absorption effect on the human body, with a comparison of the different methods of assessing the specific absorption rate. A further hazard may be the ignition of explosive mixtures by electromagnetic fields. (6 refs.) *A.G.P.*

73629 Glass-ceramic-mediated, magnetic-field-induced localized hyperthermia: response of a murine mammary carcinoma. A.A.Luderer (Research & Dev. Labs., Corning Glass Works, Corning, NY, USA), N.F.Borrelli, J.N.Panzarino, G.R.Mansfield, D.M.Hess, J.L.Brown, E.H.Barnett, E.W.Hahn.
Radiat. Res. (USA), vol.94, no.1, p.190-8 (April 1983).
Hyperthermia has been found to be a useful modality for cancer therapy. In this report, a biocompatible, ferrimagnetic glass-ceramic capable of inducing localized hyperthermia by hysteresis heating upon exposure to an alternating magnetic field is presented. When the glass-ceramic was placed in the region of a subcutaneously transplanted, weakly antigenic breast carcinoma and subjected to the magnetic field, sufficient temperature rise was obtained to cause significant (~50%) tumor regrowth delay and a 12% permanent control. The data demonstrate that glass-ceramic-mediated hysteresis heating may be a useful therapeutic approach in the treatment of cancer which offers the advantage of producing a highly localized and predictable tumor volume hyperthermia. (24 refs.)

73630 Cell surface effect of 60-Hz electromagnetic fields. M.T.Marron, B.Greenebaum, J.E.Swanson, E.M.Goodman (Biomedical Res. Inst., Univ. of Wisconsin-Parkside, Kenosha, WI, USA).
Radiat. Res. (USA), vol.94, no.1, p.217-20 (April 1983).
Physarum polycephalum amoebae grown in liquid medium and exposed simultaneously to a 60-Hz sinusoidal electric field of 1.0 V/m (rms) and a 60-Hz sinusoidal magnetic field of 0.1 mT (rms) imposed at right angles in phase with the electric field have a smaller partition coefficient in a two-phase aqueous polymer system than control cultures. This observation implies a variation in either cell surface charge or cell surface composition due to field exposure. (25 refs.)

87.50B Interactions of biosystems with radiations

73631 Light gradients in plant tissue. M.Seyfried, L.Fukshansky (Inst. fur Biologie II, Univ. Freiburg, Freiburg, Germany).
Appl. Opt. (USA), vol.22, no.9, p.1402-8 (1 May 1983).
In this paper the authors suggest a method of calculating light gradients in scattering and absorbing media. The method is based on the Kubelka-Munk theory and involves computational modeling of light fluxes in a multilayered

object, when every layer satisfies the prerequisites of the Kubelka-Munk theory. The model also includes specular reflection that may contribute strongly to internal photon fluence rates for diffuse light. To illustrate the possible effects of light gradients, a cotyledon of Cucurbita pepo is described in terms of this model. It is argued that a number of results in in vivo spectroscopy cannot be correctly interpreted unless light gradients or optics in general are included in the discussion, i.e. the light flux at the site of the pigment has to be known. To outline the difficulties involved some methods of measuring light gradients or internal photon fluence rates are critically considered. (30 refs.)

87.50E Bio-optics (effects of microwaves, light, laser and other electromagnetic waves)

73632 **Mechanism of the microwave effect on the conductivity of bilayer lipid membranes.** S.I.Alekseyev, V.V.Chertishchev, Yu.A.Kim (Inst. of Biological Phys., Acad. of Sci., Pushchino, USSR).
Biophysics (GB), vol.27, no.3, p.564-6 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.545-6 (1982).
The ratio of the change in conductivity, compared to its original value, against the specific absorbed power of the high-frequency electromagnetic field used has been measured and analysed. The dependence of the change in conductivity on specific absorbed power was linear. The results indicate the local thermal nature of the action of high-frequency electromagnetic fields on bilayer lipid membranes. (7 refs.)

73633 **Non-thermal effect of UHF pulses of nanosecond duration on the transepithelial transfer of sodium ions.** N.D.Devyatkov, Z.S.Chernov, O.V.Betskii, T.A.Novskova, A.V.Butvinskii (Inst. of Radioengng. & Electronics, Acad. of Sci., Moscow, USSR).
Biophysics (GB), vol.27, no.3, p.572-4 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.552-3 (1982).
Proposes a new approach to study of the non-thermal effects of the interaction of radiation with matter based on the use of u.h.f. radiation in the form of short pulses of nanosecond duration the peak power of which reaches tens and hundreds of MW. General heating of the irradiated specimen practically does not occur. To verify this possibility a relativistic u.h.f. nanosecond generator of the reciprocal wave tube type was developed based on an electron accelerator with a cathode working in the regime of explosive emission. The main parameters of the generator are described. Experiments on frog skin are described. (5 refs.)

73634 **Effect of laser radiation on the synthesis of lipids in yeasts.** L.P.Koval'chuk, S.A.Burtseva, P.N.Razumovskii (Dept. of Microbiology, Acad. of Sci., Kishinev, USSR).
Biophysics (GB), vol.27, no.3, p.574-5 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.554-5 (1982).
Reports experiments showing the active influence of laser rays in changing the biosynthesis of total lipids and their fractions in Rh. gracilis k-1 yeasts. (2 refs.)

87.50G Ionizing radiations (u.v., X-ray, gamma-ray; particle radiation effects)

73635 **Radiation physics, dosimetry, chemistry and biology. IV. To the physical frame of the microscopic radiobiological action.** J.Bednar (Inst. of Nuclear Res., Czechoslovakia).
Jad. Energ. (Czechoslovakia), vol.29, no.4, p.126-8 (April 1983).
For pt.III see ibid., vol.28, no.1, p.8 (1982). The physical frame of primary action of ionizing particles is shown in terms of quantum dynamics while that of the radiobiological action in terms of stochastics. A cursory attempt to associate some physical notions with the radiobiological notions of target, hit, etc., is made. (8 refs.)

73636 **Radiation biology: the conceptual and practical impact on radiation therapy.** H.D.Suit (Dept. of Radiation Medicine, Massachusetts General Hospital, Harvard Medical School, Boston, MA, USA).
Radiat. Res. (USA), vol.94, no.1, p.10-40 (April 1983).
Radiation biology has had an important impact on clinical radiation therapy by providing a rationale for implementation of new treatment strategies and for clinical concepts or practices thereby increasing their acceptance. The observed rather narrow range of D_0 and n values for mammalian cells contributed to successful trials of radiation treatment of several 'radiation-resistant' tumors, e.g. carcinoma of prostate, color-rectum, and sarcoma of soft tissue. Attention of clinicians was forcibly directed to assessment of local results (local failure, treatment complications) and not merely survival at 5 years by the extensive literature of cell survival curves (in vivo and in vitro) and dose-response assays on normal and tumor tissues. Upon these same laboratory results a scientific rationale was developed for use of shrinking field technique, low dose for subclinical disease, and the combination of moderate dose radiation therapy and conservative surgery. The entire area of clinical research into altered dose fractionation schedules is based upon research on cell proliferation kinetics and repair of radiation damage. The understanding that the time for complete regression of tumor depends not only upon cell kill but also on the pattern of cell proliferation of the progeny of lethally irradiated cells and the abundance of stroma provided a basis for accepting patients with slowly responding tumors for treatment. There remains a wide field of need in research in this area as even today a large proportion of patients who die of cancer die with their cancer uncontrolled at the primary stage. (112 refs.)

73637 **The oxygen enhancement ratio for single- and double-strand breaks induced by tritium incorporated in DNA of cultured human T1 cells. Impact of the transmutation effect.** G.Tisljar-Lentulis (Inst. of Medicine, Nuclear Res. Center Julich GmbH, Julich, Germany), P.Henneberg, L.E.Feinendegen.
Radiat. Res. (USA), vol.94, no.1, p.41-50 (April 1983).
The effect of oxygen, expressed as the oxygen enhancement ratio (OER), on the number of single-strand breaks (SSB) and double-strand breaks (DSB) induced in DNA by the radioactive decay of tritium was measured in human T1 cells whose DNA had been labeled with tritium at carbon atom number 6 of thymidine. Decays were accumulated in vivo under aerobic conditions at 0-1°C and at −196°C and in a nitrogen atmosphere at 0-1°C. The number of SSB and DSB produced was analyzed by sucrose gradient centrifugation. For each tritium decay there were 0.25 DSB in cells exposed to air at 0-1°C and 0.07 in cells kept under nitrogen, indicating an OER of 3.6, a value expected for such low-LET radiation. However, for each tritium decay there were 1.25 SSB in cells exposed to air at 0-1°C and 0.76 in cells kept under nitrogen indicating an OER of only 1.7. The corresponding values for ^{60}Co γ radiation, expressed as SSB per 100 eV absorbed energy, were 4.5 and 1.0, giving an OER of 4.5. The low OER value found for SSB induced by tritium decay can be explained if 31% of the total SSB produced in air result from transmutation by a mechanism which does not produce DSB and is unaffected by oxygen. (35 refs.)

73638 **X-irradiation effect on human red cells: hemoglobin study by Mossbauer spectrometry.** A.Chevalier, C.Kellershohn, J.N.Rimbert (Lab. de Biophys., Faculte de Medecine Necker-Enfants Malades, Paris, France).
Radiat. Res. (USA), vol.94, no.1, p.51-65 (April 1983).
Reports a study of the radioinduced transformations undergone by intraglobular hemoglobin. Mossbauer spectrometry allows one to study in a wide range of doses the effect of X-rays on deoxyhemoglobin as well as on oxyhemoglobin. Using this technique the authors have shown large differences between these two derivatives of hemoglobin. Deoxyhemoglobin leads to the formation of only one ferric nonheme compound while oxyhemoglobin produces this same compound as a last step after intermediary production of deoxyhemoglobin, methemoglobin, hemichromes, and hemochromes. The authors have also found that heat incubation and X-rays have a similar effect on HbO_2 except for the dissociation, which is absent in heat incubation. The authors have found a value for the energy needed for such a radiodissociation of HbO_2 similar to that given by other authors utilizing other methods. Finally, some explanations are proposed for the formation of the different compounds involved based on structure considerations. (28 refs.)

73639 **Inhalation carcinogenesis of high-fired $^{241}AmO_2$ in rats.** C.L.Sanders, J.A.Mahaffey (Biology Dept., Pacific Northwest Lab., Richland, WA, USA).
Radiat. Res. (USA), vol.94, no.1, p.66-80 (April 1983).
Wistar rats were given a single inhalation exposure to high-fired $^{241}AmO_2$ particles and examined over their life span. A total of 310 rats were used: 259 exposed to ^{241}Am for life-span study, 30 exposed to ^{241}Am for early metabolism study, and 21 unexposed life-span controls. The activity median aerodynamic diameter of the aerosols was 0.75-1.39 μm. About 55% of alveolarly deposited ^{241}Am was cleared from the lung with a half-life of 0.5 days, 37% with a half-life of 7 days, and 8% with a half-life of 580 days. Group mean lung doses ranged from $<$5.7 rad up to 1500 rad. Significant early mortality due to radiation pneumonitis was seen only in the highest exposure group. The percentage of rats with lung tumors was 0% for controls (21 rats), 1% at lifetime lung doses $<$10 rad (139 rats), 7% at 10-50 rad (86 rats), 0% at 50-100 rad (9 rats), 60% at 100-500 rad (10 rats), and 7% at 500 rad (15 rats). Only one liver and one bone tumor were found in all exposed rats, both at lifetime tissue doses $<$10 rad. The fate and carcinogenicity of inhaled $^{241}AmO_2$ in the lung of rats were similar to what has previously been described for inhaled $^{244}CmO_2$. (31 refs.)

73640 **Dose-rate effects in mammalian cells. IV. Repairable and nonrepairable damage in noncycling C3H $10T^{1}/_{2}$ cells.** R.L.Wells, J.S.Bedford (Dept. of Radiology & Radiation Biology, Colorado State Univ., Fort Collins, CO, USA).
Radiat. Res. (USA), vol.94, no.1, p.105-34 (April 1983).
Repairable and nonrepairable components of γ-ray damage leading to cell reproductive death were determined by measuring the range over which dose rate influenced the response of noncycling C3H $10T^{1}/_{2}$ mouse cells. Cell proliferation and cell cycle redistribution were eliminated as factors influencing the dose-rate effect in the system by irradiating confluent monolayers of contact inhibited cells. The radiosensitivity of the cells did not change, and no selective loss of damaged cells occurred over the extended treatment times. A pronounced dose-rate effect was observed over the range between 55.6 and 0.29 Gy/hr, but a limit to the repair-dependent dose-rate effect was reached at 0.29 Gy/hr since no further reduction in effect per unit dose was observed when the dose rate was reduced to 0.17 or 0.06 Gy/hr. The survival curves, which were simple exponential functions of dose at dose rates of 0.29 Gy/hr and below, have a common D_0 of 7.32 Gy and represent an accurate measurement of the nonrepairable component of damage. Log-phase cultures showed remarkably different responses over the range of dose rates, due in large part to cell cycle redistribution and in some cases, cell proliferation during exposures. (69 refs.)

73641 **Effects of ^{60}Co radiation on synthesis of prostaglandins $F_{2\alpha}$, E, and thromboxane B_2 in lung airways of guinea pigs.** L.K.Steel, I.K.Sweedler, G.N.Catravas (Biochem. Dept., Armed Forces Radiobiology Res. Inst., Bethesda, MD, USA).
Radiat. Res. (USA), vol.94, no.1, p.156-65 (April 1983).
At 1 hr to 14 days after total-body exposure of guinea pigs to 3.0 Gy ^{60}Co, changes were detected in prostaglandin concentrations in bronchial airway tissues. At 3 hr postexposure, tissue levels of PGE were significantly elevated, while at 48 hr transiently elevated levels of $PGF_{2\alpha}$ were observed. By 72 hr, levels returned to control values. Airway synthesis of thromboxane B_2 in irradiated animals did not differ from that in controls. Also assessed were the capacities of bronchial airway preparations to respond to H-1 receptor stimulation by the exogenous addition of histamine or transmembrane divalent cation transport stimulation with ionophore. Tissues from irradiated animals demonstrated alterations in the amount and type of prostaglandins generated, varying with time postirradiation. (42 refs.)

73642 **Response of mouse small intestine to fractionated doses of pions.** K.R.Rao, H.Fritz-Niggli (Strahlenbiologisches Inst., Univ. Zurich, Zurich, Switzerland).
Radiat. & Environ. Biophys. (Germany), vol.21, no.4, p.247-54 (1983).
The effect of single or fractionated doses of stopping pions or 200 kV X-rays on the mouse jejunal crypt cells was used to determine in vivo RBE values. For single fraction, the pion/X-ray RBE was 1.27 and it increased to about 1.31 when two fractions were applied at 3 or 24 h interval. When four fractions were given at 3 h intervals, the RBE was 1.46. This is because the fraction of 'dose repaired' was always higher for X-rays than for pions and this difference was enhanced when more dose fractions were used. The data presented are, in general, consistent with the biological effects of pions reported for other in vivo end points. (22 refs.)

73643 **Increased radioresistance of cells in cultured multicell spheroids. II. Kinetic and cytogenetic studies.** G.Hinz, H.Dertinger (Inst. fur Genetik und fur Toxikologie von Spaltstoffen, Kernforschungszentrum Karlsruhe, Karlsruhe, Germany).
Radiat. & Environ. Biophys. (Germany), vol.21, no.4, p.255-64 (1983).
For pt.I see ibid., vol.19, p.101-7, 1981. Using the Chinese hamster cell line B14 FAF28, several specific properties of the contact effect (CE) of radiation action in spheroids were investigated. CE was found to 'protect' the spheroid cells against several types of radiation-induced cytogenetic misfunctions such as blockage in S and G_2+M-phase, mutagenesis, and chromosome damage. However, repair of DNA strand-breaks was the same in monolayers and spheroids. Furthermore, CE is a property of the single cell and does not

depend on the proliferative status (cycling or non-cycling) of the cells. It is concluded that CE is the result of a physiological modification of the cells occurring during growth in the three-dimensional spheroid matrix and requiring metabolic cooperation and cyclic AMP for its induction. (23 refs.)

73644 RBE of spleen CFU-S to low dose rate Cf-252 neutron or photon radiation. Y.Maruyama, J.M.Feola, H.N.Hwang, A.Williams, J.L.Beach (Radiation Therapy Oncology Center, Univ. of Kentucky Medical Center, Lexington, KY, USA).
Radiat. & Environ. Biophys. (Germany), vol.21, no.4, p.265-74 (1983).
The RBE of Cf-252 neutron irradiation was determined for hemopoietic tissue using spleen CFU-S. Radiosensitivity was compared to acute Cobalt-60 radiation and low dose rate Cesium-137 under identical irradiation conditions. The RBE for the neutron component of the Cf-252 radiation was 2.1. No dose rate effect was observed for hemopoietic CFU-S to acute doses or low dose rate photon irradiation. (25 refs.)

73645 Accumulation and lethal effect of tritium (tritiated water) in Rhodopseudomonas spheroides under light-anaerobic and dark-aerobic conditions. T.Inomata (Dept. of Radiation Res., Tohoku Univ. School of Medicine, Sendai, Japan).
Radiat. & Environ. Biophys. (Germany), vol.21, no.4, p.281-94 (1983).
The distribution of exchangeable ^{3}H in cold acid-soluble and ether-ethanol-soluble fractions and nonexchangeable ^{3}H bound to small molecules and macromolecules was 7.4/25.3/67.3 in growing cells cultured anaerobically in THO-medium up to the late exponential phase in the light. The distribution in nongrowing cells incubated anaerobically with the THO-medium for 18 h in light of 300 and 3000 lux was 82.1/8.4/9.5 and 58.2/19.2/22.6, respectively. These distributions of ^{3}H were changed with growth phase and/or incubation time. On the biological effect of ^{3}H-THO on cells stocked at −196°C to accumulate ^{3}H-decays, dark-aerobic nongrowing cells labelled with THO were rather more radiosensitive than dark-aerobically and light-anaerobically grown cells cultured in the THO-medium. The killing efficiencies, i.e. the probability that a single disintegration would be lethal, ranged from $^1/_{200}$ to $^1/_{275}$ for the above three kinds of cells labelled with THO. The killing efficiencies for *R.* spheroides labelled with THO were similar to that for the radiosensitive strain CB13 and the wild strain Hfr of Escherichiacoli labelled with ^{3}H-thymidine and stored at −196°C. (23 refs.)

73646 Evidence for radiation-induced bulky lesions in DNA. H.Martin-Bertram, E.Rumpf, C.Winkler (Inst. fur Biologie, Gesellschaft fur Strahlen- und Umweltforschung, Neuherberg/Munchen, Germany).
Radiat. & Environ. Biophys. (Germany), vol.21, no.4, p.305-7 (1983).
To dissect the contribution of modified bases on the deformation of the DNA structure, independently from a specific base lesion, the authors probed the existence of bulky lesions after UV-irradiation of λ-DNA and after γ-irradiation of bacteriophage λ. (6 refs.)

73647 Discrete time estimation of the mean Doppler frequency in ultrasonic blood velocity measurements. B.A.J.Angelsen, K.Kristoffersen (Div. of Engng. Cybernetics, Univ. of Trondheim, Trondheim, Norway).
IEEE Trans. Biomed. Eng. (USA), vol.BME-30, no.4, p.207-14 (April 1983).
A new Doppler frequency estimator operating in the discrete time domain is derived from an analysis of the Doppler signal statistics. It is shown that the estimator gives a nearly unbiased estimate of the mean frequency of the signal spectrum, regardless of the spectrum shape. The discrete time implementation gives the advantage that, under specified conditions, the range-velocity product of a pulsed Doppler velocity meter can be increased. (10 refs.)

73648 Theoretical framework for spectrum analysis in ultrasonic tissue characterization. F.L.Lizzi, M.Greenebaum, E.J.Feleppa, M.Elbaum (Riverside Res. Inst., New York, NY, USA), D.J.Coleman.
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1366-73 (April 1983).
An analytic model is described for application in ultrasonic tissue characterization. The model is applicable to clinical broadband pulse echo systems. It treats spectra derived from received echo signals and related them to physical tissue properties. The model can be applied to deterministic tissue structures (e.g., retinal detachments, larger blood vessels, and surface layers of the kidney) and to stochastic tissue structures (e.g., various tumors). The beam patterns included in the model are those generated by focused transducers typically used in high-resolution clinical ultrasound. Appropriate calibration procedures are also treated: these are needed for interpretation of absolute spectral parameters. The results obtained with the analytic model have been used to design a digital processing system and the associated techniques which are now being applied during examinations of the eye and abdominal organs. The results have proven useful in interpreting data from various types of tissues. To illustrate the application of these results, representative clinical data, obtained from the digital system, are presented for two types of tissue architectures. The first case is a detached retina representing a deterministic structure characterized by well-defined thickness and reflection coefficients. The second case is asteroid hyalosis and represents a stochastic entity in which the positions of small scattering particles are best described in statistical terms, and characterization is accomplished by means of normalized power spectra. (15 refs.)

73649 Ultrasonic diffraction tomography using higher-order solution of perturbation. A.Kawanaka, K.Nakayama (Faculty of Sci. & Technol., Sophia Univ., Tokyo, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part D (Japan), vol.J66D, no.2, p.190-7 (Feb. 1983). In Japanese.
The ultrasonic diffraction tomography which reconstructs the ultrasound velocity distribution of an object based on the 1st-order solution of perturbation of the wave equation has already been reported. The authors introduce complex refractive index in order to deal with dissipative media. Moreover, by means of representing its distribution using higher-order terms of perturbation, they derive a new method that reconstructs complex refractive index distribution taking into account of the higher-order solution of perturbation. The computer simulation result on a dissipative object is presented that indicates the consideration of the 2nd-order solution of perturbation and improves the reconstructed image comparing with the 1st-order solution of perturbation. 73650 Optimal field for detection of magnetically labeled blood. J.H.Battocletti, R.E.Halbach (Dept. of Neurosurgery, Medical Coll. of Wisconsin, Milwaukee, WI, USA).
J. Magn. Resonance (USA), vol.52, no.3, p.500-4 (May 1983).
The authors comment on a recently published paper by Pochobradsky (see ibid., vol.48, p.63 (1983)) on the optimization of the tag-detect technique of blood flow measurement using proton nuclear magnetic resonance. The important consideration in implementing the tagging technique in a usable NMR flowmeter is signal-to-noise ratio. Therefore, the absolute change in magnetization (ΔM) is most important. Second, and reinforcing this conclusion, the change in voltage generated by ΔM is usually amplified in an AC amplifier which removes the steady-state component of M. This becomes even more important when magnetization of stationary tissue occurs, and the steady-state component of M must be removed so as not to saturate the low-frequency amplifiers. (6 refs.)

73651 A microcomputer-based multithermocouple system for use in microwave fields. P.R.Horseman, D.J.Law, P.B.Dunscombe, K.Gammampila, B.M.Southcott (Dept. of Medical Phys., Charing Cross Hospital, London, England).
J. Med. Eng. & Technol. (GB), vol.7, no.2, p.96-100 (March-April 1983).
A PET-controlled multithermocouple system employing Analog Devices 4 channel amplifiers has been constructed. The intended application of the equipment is the measurement of the temperature distribution in patients receiving microwave hyperthermia as part of cancer therapy. The equipment has been shown to be sufficiently accurate and, in addition, is not susceptible to RF interference at the power levels in use in the authors' hospital for microwave hyperthermia. (8 refs.)

73652 Medical imagery. D.B.Isabelle, A.Veyre (Lab. of Corpuscular Phys., Univ. of Clermont-Ferrand II, Clermont-Ferrand, France).
Recherche (France), vol.14, no.144, p.690-2, 695-8, 701-6 (May 1983). In French.
Until the last twenty years the doctor who wished to explore the body of his patient had only X-rays and radiography. The latter remains irreplaceable. A new technique is being developed—that of nuclear magnetic resonance and the paper deals with this. The developments in X-ray techniques are first described, including the application to them of computer science. Then follows a description of the development of nuclear magnetic resonance techniques. The key to radiography is the possibility of obtaining better contrast in the images. The use of radioactive material introduced into the body is described, from its early days, including its use to give numerical details of dynamic performance. Work is now towards a space representation of the organ examined. Tomography by emission is described, as are temperature charts. (9 refs.) *G.V.D.*

73653 Therapeutic applications of electromagnetic heating. L.S.Taylor (Dept. of Electrical Engng. & Radiation Oncology, Univ. of Maryland, College Park, MD, USA).
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.425-31 part 1
A review of the general history of the medical applications of radio-frequency and microwave fields is followed by a discussion of the particular use of microwave fields to produce hyperthermia for cancer therapy, and to produce coagulation in surgery. A possible new class of electromagnetic applicators suitable for deep-lying tumors, and a new electrosurgical tool are described. The question of radiation safety is discussed both in the context of therapeutic applications and in relation to the effects of low level fields. (14 refs.)

73654 Design of microwave hyperthermia applicators for optimum power transfer. R.H.Johnson, J.R.James (Royal Military Coll. of Sci., Shrivenham, England).
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.485-9 part 1
Demonstrates by computations using plane wave methods the significance of the impedance match between the applicator and various combinations of body tissue layers. The authors then describe simple low-profile applicators having a resonant radiator embedded in low loss high permittivity material ($\epsilon'=30$). By introducing material having significant permeability as well as high permittivity it is shown that the operating frequency can be reduced for a given applicator size while permitting a good power transfer. The resolution or area that can be heated is a direct function of applicator size. (8 refs.)

73655 Optical fiber thermometer for medical use. A.M.Scheggi, M.Brenci, G.Conforti, R.Falciai, G.P.Preti.
First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.13-16
Describes a new temperature sensor utilizing attenuation of the light transmitted along a multimode fiber, induced by a temperature sensitive clad applied on a terminal portion of the fiber. The temperature sensor proposed utilizes a silica plastic fiber with an unclad terminal portion and a reflecting end face, immersed in a liquid having a refractive index equal or higher than that of the silica core. Different mineral oils or mixtures have been used as temperature sensitive liquids and correspondingly different intervals in a large range of temperature can be covered so to utilize the thermometer for various applications such as electrical equipment monitoring, r.f. or microwave heating techniques for industrial applications. The reduced probe dimensions and the sensitivity already obtained make this sensor promising for medical use, in particular for localized temperature control in hyperthermia treatment. (8 refs.)

73656 Repositioning errors in measurement of vertebral attenuation values by computed tomography. E.Breatnach, P.J.Robinson (Diagnostic Imaging Unit, St. James's Hospital, Leeds, England).
Br. J. Radiol. (GB), vol.56, no.665, p.299-305 (May 1983).
Difficulty in repositioning makes a major contribution to reproducibility errors in measurements of bone mineral by computed tomography (CT). The magnitude of measurement variations arising from incremental movements in each of three directions of displacement and two directions of rotation were investigated using two sections of cadaver spines each including three vertebral bodies. Within the range of variation in position readily attainable by currently available scan plane selection techniques, changes in measured attenuation were small. Estimated variations resulting from compounded errors of different movements averaged 8.3 Hounsfield units for a single vertebra and 4.9 Hounsfield units for three adjacent vertebrae. The largest change in measured attenuation which could be attributed with 95% confidence to repositioning error within the quoted limits of scan plane selection was estimated to be approximately 15 HU for a single vertebra and 8HU for three adjacent vertebrae. (9 refs.)

73657 Electron contamination of large cobalt 60 photon beams. J.F.Sutcliffe (Phys. Dept., Royal Devon & Exeter Hospital, Exeter, England), G.S.Innes.
Br. J. Radiol. (GB), vol.56, no.665, p.321-8 (May 1983).
Experimental results are presented of the electron contamination of cobalt 60 gamma photon beams from the Mobaltron MS80, over a range of SSDs from 60 cm to 3.5 m. In the absence of an electron filter, the skin dose can exceed the dose at 4 mm depth by up to 1.6 times due to the high level of electron emission from the depleted uranium collimators. 4mm of perspex effectively removes these electrons, and in the filtered beam, the skin dose cannot exceed the 4 mm dose. The electron contamination of a 6 MV X-ray beam is compared. (10 refs.)

73658 An accurate and automatic positioning system for penumbra wedges applicable to the radiotherapy of Hodgkin's disease. R.J.de Vos (Radiotherapy Inst., Limburg, Netherlands).
Br. J. Radiol. (GB), vol.56, no.665, p.339-40 (May 1983).
The steep cross-sectional dose gradient at the field edges of linear accelerators strongly affects the junction of extended fields as used in the irradiation of Hodgkin's disease. This problem is alleviated by flattening the dose gradient at the junction edge, where the field covers the spinal cord, by means of a so-called penumbra wedge. A description is given of a system which adjusts the position of the penumbra wedge as a function of the chosen field size. The system has been designed to simplify handling for the radiographers and to optimise reliability. (2 refs.)

73659 Gamma camera MTF measurements using an image chain analysis approach. G.Q.Maguire,Jr., M.E.Noz, J.H.Schimpf, S.C.Horii (Dept. of Radiology, New York Univ., New York, NY, USA).
Comput. & Biomed. Res. (USA), vol.16, no.2, p.149-59 (April 1983).
Image chain analysis is applied to the determination of the modulation transfer function (MTF) for a gamma camera. A simple method for performing this measurement for the purposes of quality control and acceptance testing is given. The parameters necessary for performance of this measurement are discussed. The computer program used is available in both FORTRAN VI and BASIC. (15 refs.)

73660 Estimation of mean transit times from semiquantitative indices derived from standard renograms. J.H.Amuasi, J.C.W.Crawley, N.Veall (Radioisotopes Div., MRC Clinical Res. Centre, Harrow, England), H.A.Wilkins, A.G.Cronquist.
Clin. Phys. & Physiol. Meas. (GB), vol.4, no.2, p.211-16 (May 1983).
Statistical analysis has been used to find the best relationship between mean transit time calculated from corrected (blood-background subtracted) renograms and empirical indices measured directly from the standard renogram. The best formula of those compared for estimating mean transit time when both time-to-peak and % maximum activity at 15 min are known is $Y=0.17+0.49X_1+0.003X_2$, where Y is a dependent variable and X_1 and X_2 are predictor variables. (7 refs.)

73661 In vivo nitrogen analysis using ^{241}Am-Be neutrons—a feasibility study for a mobile facility. B.W.East (Health Phys. & Nuclear Medicine Unit, Scottish Univs. Res. & Reactor Centre, Glasgow, Scotland).
Clin. Phys. & Physiol. Meas. (GB), vol.4, no.2, p.217-21 (May 1983).
The possibility of adapting the East Kilbride mobile whole-body counter laboratory for the capture gamma-ray analysis of nitrogen in vivo has been examined. The results of the preliminary work reported are promising. (9 refs.)

73662 A critique of the breath-by-breath radioabsorptiometric assay of stable xenon in expired air [and reply]. V.Dhawan (Cotzias Lab. of Neuro-Oncology, Memorial Sloan-Kettering Cancer Center, New York, NY, USA), J.E.Holden.
Clin. Phys. & Physiol. Meas. (GB), vol.4, no.2, p.231-2 (May 1983).
A paper by W.R. Ip et al. (ibid., vol.3, p.151-4, 1982) is commented on by Dhawan. Dhawan says that although the computerised tomographic radioabsorptiometric method for monitoring end-tidal Xe concentration is promising, the detector design proposed by Ip et al. is far from ideal and requires considerable modification if radioabsorptiometry is to replace thermoconductivity or mass spectrometric measurements of end-tidal Xe concentration. In reply for Ip et al. Holden refutes the comments of Dhawan maintaining that their measurement precision still stands, that their data were not compressed and implying that their detector design was necessary. (4 refs.)

73663 The future of radioiodines. G.L.DeNardo (Davis Medical Center, Univ. of California, Sacramento, CA, USA).
J. Radioanal. Chem. (Switzerland), vol.76, no.2, p.337-40 (1983).
The author reviews the history of medical uses of radioiodines and describes possible future advances in this field. (7 refs.)

73664 The generator production of ^{172}Lu from ^{172}Hf for limited nuclear medicine research. P.M.Grant, R.J.Daniels, W.J.Daniels, G.E.Bentley, H.A.O'Brien,Jr. (Medical Radioisotope Res. Group, Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Radioanal. Chem. (Switzerland), vol.76, no.2, p.319-23 (1983).
A solvent extraction system has been developed for the separation of ^{172}Lu from its long-lived ^{172}Hf parent. The parent-daughter pair in equilibrium is maintained in a solution of HDEHP, and the heavy lanthanide daughter is extracted into 9M HCl. The separation factor for this generator is approximately 10^4. The rare-earth activity so obtained is proposed for compound labelling research and animal biodistribution studies in nuclear medicine. 73665 Tissue-air ratios for cobalt 60 therapy units. S.M.Vatnitskij (Central Sci. Res. Inst. of Roentgenology & Radiology, Min. of Health, Leningrad, USSR), P.K.Aalto, S.J.Rannikko.
Br. J. Radiol. (GB), vol.56, no.665, p.315-19 (May 1983).
Tissue-air ratio (TAR) is the widely used dosimetric parameter for treatment planning in radiation therapy. Comparison of the measured TAR values of 19 ^{60}Co therapy units of eight different types was made with the widely used tabulated data of Gupta and Cunningham (1966). The experimental data, and the analysis of the variation in the TAR values caused by individual, unit by unit features, show that discrepancies may be up to ±4%. (22 refs.)

73666 Exit dose studies in megavoltage photon therapy. G.D.Lambert, W.E.Liversage, A.M.Hirst, D.Doughty (Dept. of Radiation Phys., St. Bartholomew's Hospital, London, England).
Br. J. Radiol. (GB), vol.56, no.665, p.329-34 (May 1983).
A coin-shaped ionisation chamber, orientated with its thin window facing away from the radiation source, was used to investigate the dose perturbations caused by the absence of back-scattering material near the exit surface of solid phantoms. Cobalt 60 and 4, 8 and 16 MV X-ray beams were used in the study. With no scattering material beyond the chamber window the ionisation was found to be as much as 17% less than the full scatter value. This was attributed to the absence of both back-scattered electrons and back-scattered photons. Full electron back-scattering could be restored by placing between 1.0 and 2.7 mm of unit density material beyond the chamber, depending on the primary beam energy. Under these circumstances the reduction in dose, now due to the absence of back-scattered photons only, was found to be small. (12 refs.)

73667 Preparation and applications of $Li_2B_4O_7$(Cu)TLD. N.Soramasu, Y.Yasuno (Electric Equipment Div., Matsushita Industrial Equipment Co. Ltd., Osaka, Japan), M.Takenaga.
Natl. Tech. Rep. (Japan), vol.29, no.1, p.170-5 (Feb. 1983). In Japanese.
A newly developed phosphor $Li_2B_4O_7$(Cu) with an atomic number of 7.3 is very similar to that of tissue. Phosphor prepared by a sintering method shows to glow peaks composed of a main peak at 205°C and a shoulder at 120°C. The material based on the stoichiometric compound of $Li_2O.2B_2O_3$ has a good moisture resistance property. The dosimetric characteristics are the sensitivity to gamma rays is about 20 times higher than that of $Li_2B_4O_7$(Mn) prepared by the melting method; the main peak of 205°C fades less than 9% in intensity at 25°C after 60 days in darkness. An evaluation method of an absorbed dose and neutron dose are also studied by using a composite TLD 'TL badge' applying the $Li_2B_4O_7$(Cu) phosphor. (7 refs.)

73668 Measurements of the annual variation of the erythema dose of global radiation. W.Ambach, W.Rehwald (Inst. fur Medizinische Phys., Univ. Innsbruck, Innsbruck, Austria).
Radiat. & Environ. Biophys. (Germany), vol.21, no.4, p.295-303 (1983).
The share of erythema dose of global radiation (D_{er}/G) shows significant diurnal and annual variations. This is the result of the dependence of the ratio D_{er}/G on optical air mass. Maximum values of D_{er}/G are found at times of low optical air mass, i.e. at noon and in summer, minimum values at sunrise and sunset hours as well as in winter. Another reason for the annual variation of the ratio D_{er}/G is the changing amount of total atmospheric ozone. Therefore values of D_{er}/G in fall are about 50% higher than in spring despite the same solar declination. Comparing measurements of erythema dose at two stations with different altitudes, a difference of 14% per 1000 m is obtained. (14 refs.)

73669 Radiation Protection. Eighth Symposium on Microdosimetry (EUR 8395 EN).
Luxembourg: Comm. European Communities (1982), xix+1221 pp.
Conference held at: Julich, Germany. Date 27 Sept.-1 Oct. 1982. The following topics were dealt with: microscopic description of radiation interactions with matter (including: charged particle track structure; high-energy particle interactions); measurement and interpretation of radiation action (including: radiation mechanisms at molecular and cellular levels; radiation mechanisms of carcinogenesis); employment of microdosimetric principles in radiation dosimetry and protection (including: radiation response of solid state detectors; determination of quality factors). 100 papers were presented.

73670 Changes in the loco-regional cerebral blood flow (r.CBF) during a simulation of weightlessness. A.Guell, Ph.Dupui, M.Barrere, G.Fanjaud, A.Bes (Dept. of Neurology, Centre Hospitalier Univ. Rangueil, Toulouse, France).
Acta Astronaut. (GB), vol.9, no.11, p.689-90 (Nov. 1982). [received: March 1983]
Experiments involving prolonged bedrest in the antiorthostatic position are conducted in order to simulate cardio-circulatory modifications observed in weightlessness. Up to now no studies of r.C.B.F. have been carried out in these conditions. Six young, healthy volunteers (average age 23.8) were placed in strict bedrest and in the antiorthostatic position −4° for 7 days. The r.C.B.F. measurements were studied by the ^{133}Xe inhalation method using a 32 detectors system. Studies were made first in basal conditions, then between the 6th and 12th hr, and finally between the 72nd and the 78th hr after the beginning of the experiment. Three of the subjects received 0.450 mg of Clonidine daily during the experiment. In the subjects having taken no Clonidine, the authors observed a constant increase in r.C.B.F. (12, 17 and 16% respectively) in the first 12 hr; at the 72nd hour, all values had returned to basal state. These findings agree with the well known notion of a rapid correction of hemodynamic disturbances observed in the first days of weightlessness. In the subjects treated with Clonidine, the increase of r.C.B.F. did not occur. Several mechanisms of action are possible; the Clonidine affecting either the heart by inhibiting volemic atrial receptors, or the brain by direct vasoconstriction. (12 refs.)

73671 Configuration design of a closed-loop, pseudogravitational, environmental research facility in low Earth orbit. J.B.Jones-Oliveira (Dept. of Astronautics & Aeronautics, MIT, Cambridge, MA, USA).
Space Sol. Power Rev. (GB), vol.3, no.4, p.317-35 (1982).
The object of the study was to design a space habitat from an architectural perspective employing today's space technologies. The primary launch vehicle, the Space Shuttle, the space transportation system (STS) carrying the modular components of the research facility to low Earth orbit (LEO), was an essential and integral technological achievement making the project possible. Therefore, the characteristics of the orbiter, specifically the allowable payload requirements for volume and weight, were major design parameters. In other words, the maximum critical dimensions of all components of the research facility were limited by the allowable volume available for payloads in the cargo bay (approximately a cylinder of 5×18 m); similarly, the maximum allowable payload requirement of 29500 kg (65048 lb) was satisfied. Given these constraints, in conjunction with other engineering problems to be discussed herein, it was the human factor that was then regarded the driving factor throughout the design process. The goal was to demonstrate the near future realizability for human health, safety, and comfort, both physical and psychological, in permanent, manned LEO facilities. The proposed mission of the Satellite Pseudogravitational Operational Research Environment (SPORE) is to accomplish a comparative research investigation examining the trade-offs among various centrifugally induced pseudogravitational forces; the associated rate of rotation, taking in the first mission to be 2 r.p.m.; the health and productivity of the scientists, as well as the biological organisms on which they will be conducting experiments; and the cost of creating the environment. (4 refs.)

87.70 BIOMEDICAL ENGINEERING

73672 A temperature-sensitive respiratory alarm. S.W.Smye, J.M.Frayne, J.Copeland (Dept. of Medical Phys., Barnsley District General Hospital, Barnsley, England), A.J.Wilson.
Clin. Phys. & Physiol. Meas. (GB), vol.4, no.2, p.223-6 (May 1983).
Describes a novel alarm which is designed to monitor respiration in a patient undergoing intermittent positive pressure ventilation. The alarm operates by sensing the temperature differences between the inspired and expired gas using a thermistor mounted close to the point in the breathing circuit where the patient connection is made. It offers several significant advantages: it is a patient-orientated device as it monitors the respiratory process; it will not register an alarm during endotracheal toilet; and it may be used on spontaneously breathing patients in the presence or absence of a constant distending pressure. Further, the thermistor alarm is unaffected by condensation and, finally, it monitors the humidifier performance (this is additional to any alarm system that may be provided with the humidifier). (no refs.)

73673 Effect of EMG onset variation on average motor potentials. H.P.Greeley (Res. Dept., Veterans Administration Hospital, White River Junction, VT, USA).
Clin. Phys. & Physiol. Meas. (GB), vol.4, no.2, p.227-30 (May 1983).
Results are reported which show that although there is a wide range of slope values at the onset of a series of EMGs, there is not serious degeneration of the average motor potential waveforms obtained using the slope dependent threshold voltages of the first half cycle as a trigger signal. This is almost certainly due to the short times involved in reaching these threshold levels as well as to the normal distribution of this error. These results confirm the advantage of setting EMG threshold levels low enough to ensure that averaging begins at the first half cycle of the EMG. (5 refs.)

73674 Automatic classification of electromyographic signals. J.L.Coatrieux (Lab. de Traitement du Signal, Faculte des Sci., Rennes, France), P.Toulouse, B.Rouvrais, R.Le Bars.
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.3, p.333-41 (March 1983).
The results of the application of classification methods to electromyograph signals of weak contractions in normal and myopathic subjects are described. Methods of pattern recognition allow the selection of representative motor unit action potentials. The analysis is done with ordinal qualitative variables obtained by identification of shape descriptive parameters (amplitude, duration, number of phases, number of extrema). From this analysis, characteristic classes for normality and myopathy appear, which can be used as a diagnostic aid. (14 refs.)

73675 Discriminating somatic evoked potentials using a pairwise procedure. Chan F. Lam (Dept. of Biometry, Medical Univ. of South Carolina, Charleston, SC, USA), M.Cox.
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.3, p.342-9 (March 1983).
Generally, investigators use only the magnitude spectra of a signal for processing or for discriminant analysis, with the phase information discarded. However, it is not difficult to generate two different time domain signals having identical magnitude spectra in the frequency domain. Thus the phase information should not be neglected. This paper presents the results of a simulation study of a discriminant analysis procedure for paired variables, e.g. magnitude and phase pairs. The procedure is then applied to discriminating somatic evoked potentials from normal and damaged spinal cords with excellent results. (9 refs.)

73676 The polarity histogram in relation to the average evoked potential. M.L.Hyde (Dept. of Otolaryngology, Mount Sinai Hospital, Toronto, Ontario, Canada), D.J.Doyle.
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.3, p.357-60 (March 1983).
It is shown analytically that the polarity histogram (PH) and the average evoked potential (AEP) are linearly related under certain conditions. The relative merits of the two approaches are compared both analytically and by statistical simulation. In general, the PH is a biased estimator of the evoked potential and is less efficient than the AEP, which is unbiased. The PH is more robust against artifact, but this advantage vanishes when conventional artifact rejection is used. The detection of an EP using the PH is problematic. The polarity histogram offers little advantage over signal averaging under typical clinical recording conditions. (6 refs.)

73677 Pressure-derived flow: a new method. J.K.-J.Li (Dept. of Electrical Engng., Rutgers Univ., Piscataway, NJ, USA).
IEEE Trans. Biomed. Eng. (USA), vol.BME-30, no.4, p.244-6 (April 1983).
Pulsatile flow waveforms in the dog femoral artery and abdominal aorta were derived from measurements of pressure before and after a brief vessel occlusion. Derived flows compared favorably with directly measured flows in the abdominal aorta, less so in the femoral artery. Possible sources of deviations are discussed. (19 refs.)

73678 A computer algorithm to calculate P_{50} from a single blood sample. L.E.Ostrander (Center for Biomedical Engng., Rensselaer Polytech. Inst., Troy, NY, USA), W.H.Paloski, P.S.Barie, W.A.Carpenter, J.C.Newell.
IEEE Trans. Biomed. Eng. (USA), vol.BME-30, no.4, p.250-4 (April 1983).
Describes an iterative computer-based algorithm which determines P_{50} while avoiding direct inversion of the relationship between blood oxygen partial pressure and oxyhemoglobin saturation. Blood sample measurements and the value of P_{50} are used, together with carboxyhemoglobin data, as necessary, to calculate blood oxyhemoglobin saturation and oxygen content. (18 refs.)

73679 Evaluation of ECG recorders.
J. Med. Eng. & Technol. (GB), vol.7, no.2, p.69-73 (March-April 1983).
Points to bear in mind before deciding which ECG recorder to buy are discussed. The following ECG recorders are evaluated: the Cambridge VS-550; the Fukuda Denshi FD-13; the Cardisuny 501F; and the Kirby Lester ECG 30. (no refs.)

73680 Evaluation of blood-pressure transducers.
J. Med. Eng. & Technol. (GB), vol.7, no.2, p.74-7 (March-April 1983).
The transducers considered are conventional transducers, 'wrist-watch' transducers and miniature transducers. The topics discussed include: domes (reusable or disposable); method of cleaning; method of excitation; durability; standards; units of blood pressure measurement. (no refs.)

73681 Microcomputer-controlled psychoacoustics in clinical audiology. M.E.Lutman (MRC Inst. of Hearing Res., General Hospital, Nottingham, England).
J. Med. Eng. & Technol. (GB), vol.7, no.2, p.83-7 (March-April 1983).
Describes the design and implementation of a microcomputer-controlled experimental rig for psychoacoustical testing in a clinical setting. Firstly, the role of psychoacoustical tests in clinical audiology is reviewed briefly. Some common test procedures are described. The requirements of the hardware and software are outlined together with their realization. Finally, the performance of the system and its usefulness are noted. (4 refs.)

73682 Theoretical prediction of the oxygen output for a dialysis membrane with a catalyst, in a flat plate dialyzer. M.Zborowski (Inst. of Biocybernetics & Biomedical Engng., Polish Acad. of Sci., Warsaw, Poland).
Biorheology (GB), vol.20, no.2, p.129-40 (1983).
Mass transfer of a solute of small molecular weight across a hydrophilic membrane is discussed and a simplification of the mass transfer analysis is proposed. It was assumed that the permeability of the boundary layer at the membrane surface depends only on the velocity gradient at that membrane surface. Theoretical results are compared with the values of oxygen output at the dialysis membrane activated with an inorganic catalyst, in the presence of hydrogen peroxide, inside a test chamber of a simple geometry and in the flat plate dialyzer. Test chamber data and the theoretical analysis allow for the prediction of the mass transfer efficiency of the dialyzer. (5 refs.)

73683 Scanning electron microscopy examination of a porous alumina prosthetic heart valve. H.Juden, C.R.Gentle (Dept. of Mech. Engng., Trent Polytech., Nottingham, England), D.Dowson.
Biomaterials (GB), vol.4, no.2, p.139-41 (April 1983).
Scanning electron microscopy has been used to examine the porous alumina body of a novel prosthetic heart valve after experimental implantation in a pig. Characteristic features of this unusual material were observed and the biological surface covering resulting from implantation was identified. (9 refs.)

73684 Prosthetic heart valve replacements. N.H.C.Hwang, Xue Zen Nan (Dept. of Civil Engng., Univ. of Houston, Houston, TX, USA), D.R.Gross.
CRC Crit. Rev. Biomed. Eng. (USA), vol.9, no.2, p.99-132 (1983).
The rapid development in the field of heart valve prostheses in the last two decades is reviewed from a hydrodynamic and hemodynamic point of view. Several types of current prosthetic heart valves perform satisfactorily under the usual clinical conditions are discussed with test data obtained in an in vitro flow loop which closely mimic the physiological pressure and flow waveforms. These data are compared with the currently available in vivo measurements from patients and experimental animals. Comparisons are also made with the published data using other in vitro flow loops. The difference and similarity in the results obtained by the various investigators are discussed in light of their physical and physiological significances. (180 refs.)

73685 Optimization and design of permanent magnet devices for retaining dental prosthetic appliances. Y.Kinouchi, T.Ushita, H.Tsutsui, Y.Yoshida (Tokushima Univ., Tokushima, Japan).
IEEE Trans. Biomed. Eng. (USA), vol.BME-30, no.4, p.201-6 (April 1983).
Attraction between a pair of rare earth-cobalt magnets is very useful for retention of dental prosthetic appliances. In these applications, the space available for embedding magnets is very narrow. Therefore, the magnets must have those optimum dimensions which cause the maximum attraction. The optimum dimensions are calculated for a rectangular or disk magnet pair utilizing the axial or radial attraction. In order to maximize the axial attraction of a magnet pair in small separation, the rectangular magnet must be slender and the square or disk magnet must have a size ratio of about 0.4, which is defined as the ratio of thickness to length of edge or diameter of the magnet. In the case of radial attraction, the optimum disk magnet has a little larger size ratio, e.g. about 0.55 in zero separation. Based on these theoretical analyses, the method of designing the optimum magnets with a required attraction is proposed. (17 refs.)

73686 Hydraulic evaluation of heart prosthetic valves (in case of mechanical valve). M.Sano, T.Nagahisa, E.Sasakawa, K.Yokoi, T.Iwa (Kanazawa Univ., Kanazawa, Japan).
Mem. Fac. Technol. Kanazawa Univ. (Japan), vol.15, no.2, p.95-102 (Nov. 1982). In Japanese.
Recently, many artificial internal organs have been used clinically. Heart prosthetic valves are one of them. Their hydraulic performance and durability may not be sufficient and further improvements are required. The hydraulic performance of prosthetic valves is examined in this study. Heart prosthetic valves in practical use are classified into biological values and mechanical values by their materials. Mechanical valve types were tested, namely: disc valve, leaflet valve and ball valve. The pressure gradient, the discharge coefficient and the effective orifice area were obtained by steady flow tests. The flow rate, the maximum pressure gradient and the ratio of the valve-full-open time to the diastolic time were obtained by pulsatile flow tests. Pulsatile tests were performed in a pulse duplicator and the flow through the valve was visualized by the aluminium powder tracer method. (4 refs.)

87.80 BIOPHYSICAL INSTRUMENTATION AND TECHNIQUES

73687 Measurement of the size distribution of human blood plasma lipoproteins. A.N.Klimov, G.Ye.Shmelev, V.A.Noskin, I.F.Mamontova, L.G.Petrova-Maslakova, N.S.Parfenova (Konstantinov Inst. of Nuclear Phys., Acad. of Sci., Leningrad, USSR).
Biophysics (GB), vol.27, no.3, p.469-74 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.458-62 (1982).
The possibility of using the method of optical mixing for studying the particle size distribution of lipoproteins (l.p.) is shown. The method is found to be sensitive for detecting changes in these distributions on incubation of lipoprotein particles in different conditions. It is shown, in particular, that on incubation of low density lipoproteins (l.d.l.p.) with erythrocytes the donor properties of the l.d.l.p. become manifest in relation to cholesterol while on incubation of high density lipoproteins (h.d.l.p.) with these cells a more complex pattern is observed. The h.d.l.p. isolated from the hypercholesterinaemic plasma exhibit donor and those isolated from the plasma with a normal CS level acceptor properties. In both cases a high degree of aggregability for the total fraction of h.d.l.p. is observed. (7 refs.)

73688 Dynamic structures and non-linear spectral transformations based on the reactions of structural interaction. A.A.Kal'nin (Ul'yanov Electric Engng. Inst., Leningrad, USSR).
Biophysics (GB), vol.27, no.3, p.524-30 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.509-14 (1982).
Outlines the principles of a structural-holographic method of processing biological signals. The method is based on excitation in a dissipative ordered medium of a distributed dynamic set of processes adequate to the external agent and the transformatory properties of associative structural reactions. (8 refs.)

73689 Determination of the size of blood lipoproteins by optical methods. S.M.Burkitbayev, G.Ye.Dobretsov, E.A.Manykin (Engng. Phys. Inst., Second Pirogov State Medical Inst., Moscow, USSR).
Biophysics (GB), vol.27, no.3, p.544-6 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.3, p.528-9 (1982).
Describes an investigation into human blood low density lipoproteins. Two optical methods were combined; fluorescent probes and optical mixing spectroscopy. It is concluded that the combination of these methods makes it possible to rapidly and simply evaluate the heterogeneity of these lipoproteins by size. (8 refs.)

73690 Erythrocyte filtrability measurement by the initial flow rate method. M.Hanss (Lab. de Biophys., Univ. Paris Nord, Bobigny, France).
Biorheology (GB), vol.20, no.2, p.199-211 (1983).
A new filtration technique, based on the initial filtration rate of a diluted RBC suspension through a 5 μ Nuclepore filter, is described. As only a few hundred RBCs traverse each pore and as the measurements are made in a few seconds, the method is largely insensitive to filter plugging and to sedimentation effects. The results are given as a filtration index IF which is, as a first order approximation, independent of the filter conductance and of the suspending medium viscosity. The filtration times are measured electronically. The filters are re-used many times. The influence on the results reproducibility of RBC washing, of the anticoagulant, of the blood sample and the suspension storage times are considered. With the author's technical procedure, the relative incertitude in the measurement of IF is about ±10%. The filtration index is shown to be an intrinsic RBC filterability property. (33 refs.)

73691 Determination of myosin light chain phosphorylation using astronomical image analysis programs on autoradiographs of electrophoretic gels. R.D.Bremel, E.O.Owens, G.M.Olins, C.M.Anderson (Univ. of Wisconsin, Madison, WI, USA).
Comput. & Biomed. Res. (USA), vol.16, no.2, p.127-35 (April 1983).
Computer image analysis programs developed by astronomers for celestial photometry were used for the analysis of autoradiographs of electrophoretic slab gels. Oxytocin-stimulated myosin light chain phosphorylation in mammary myoepithelial cells was studied by incubating cells with $[^{32}P]$orthophosphate followed by oxytocin addition, polyacrylamide gel electrophoresis of cellular protein, and autoradiography of electrophoretic slab gels. After scanning and digitization of autoradiographs, $[^{32}P]$phosphate incorporation into the myosin light chain was measured by the determination of radiation flux recorded on the X-ray film. Within seconds after oxytocin addition, the myosin light chain was fully phosphorylated. The large library of astronomical computer programs has applications for the quantitative analysis of both one- and two-dimensional electrophoretic gels. (11 refs.)

73692 Visual evoked potentials to light flash in cats: is a frontal sinus reference electrode truly indifferent?. P.M.Saxton, J.Siegel (School of Life & Health Sci., Univ. of Delaware, Newark, DE, USA).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.3, p.350-4 (March 1983).
In flaxedilized cats, visual cortex evoked potentials (VEPs) to an intensity series of brief light flashes were recorded differentially using either a screw over frontal sinus or an insect pin in neck muscle as the reference electrode. At the same time EPs from the cornea (the ERG) and frontal sinus were recorded differentially against the neck muscle electrode. The EP recorded from the frontal sinus screw was a miniature of the ERG recorded from the cornea, with the same latencies and shape as the ERG but only 10-30% of its amplitude. At a fast presentation rate (1/sec) the amplitude of the ERG, and consequently the frontal sinus potential, decreased with increasing intensity of light flash, whereas at a slow presentation rate (1/3 or 1/5 sec) the ERG and frontal sinus potential increased in response to all but the highest intensities. The effects of the location of the reference electrode and the rate of light flash presentation on visual cortex EP amplitudes are described. (6 refs.)

73693 A simple noise clipping circuit for neurophysiological audio monitors. J.Millar, T.G.Barnett (Dept. of Physiology, London Hospital Medical Coll., London, England).
Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.3, p.355-6 (March 1983).
A very simple circuit is described which removes the low amplitude components of audio frequency signals, leaving the positive and negative peaks superimposed on a flat baseline. The clipping is symmetrical and adjustable in gain. Thus the baseline noise in audio monitors used in extracellular single-unit recording can be attenuated. This enhances the aural discrimination of single units and reduces aural fatigue. (5 refs.)

73694 A low-noise low input impedance amplifier for magnetic measurements of nerve action currents. J.P.Wikswo,Jr., P.C.Samson (Vanderbilt Univ., Nashville, TN, USA), R.P.Giffard.
IEEE Trans. Biomed. Eng. (USA), vol.BME-30, no.4, p.215-21 (April 1983).
Describes a low-noise solid-state current-to-voltage amplifier to measure the magnetic fields produced by nerve action currents. The amplifier senses the EMF induced in a toroidal, ferrite-core pickup coil surrounding the nerve by the circumferential magnetic field associated with the axial nerve action currents which propagate past the toroid. In order to obtain low input voltage noise, the input stage of the amplifier consists of 20 preamplifiers in parallel, each containing a discrete bipolar transistor pair. The complete amplifier has an input impedance of 1.33 Ω and a minimum noise figure of 1.5 dB at 100 Hz for a source resistance of 50 Ω. The amplifier has sufficient sensitivity to detect the magnetic field of the action potential propagating along a single giant axon. (17 refs.)

73695 A light-scattering apparatus for the study of cellular suspensions. J.E.Powers (Advanced Technol. Labs., Bellevue, WA, USA), H.Gutekunst, H.Affolter, A.Pletscher, R.G.Buckles.
IEEE Trans. Biomed. Eng. (USA), vol.BME-30, no.4, p.228-31 (April 1983).
A system is described which uses scattered laser light to study the kinetics of cellular suspensions. The scattered light is collected by optical fibers placed at 10° increments around the cuvette. With a novel normalization scheme all outputs are made proportional to the percentage change relative to the values measured upon insertion of the sample. The system includes a noise level detector to give an output proportional to the relative amplitude of fluctuation of the light intensity. The apparatus has been used primarily for the study of human blood platelets. Preliminary results indicate that the noise level is a measure of platelet shape, whereas the average amplitude of light scattered at 40° shows sensitivity to pseudopod formation. Thus, the authors can distinguish between shape change, pseudopod formation, and aggregation of the platelets. (18 refs.)

73696 The quantification and graphic display of correlations among three spike trains. M.Abeles (Dept. of Phys., Hebrew Univ., Jerusalem, Israel).
IEEE Trans. Biomed. Eng. (USA), vol.BME-30, no.4, p.235-9 (April 1983).
The correlation among three nerve cells may be plotted as a three-dimensional graph. On the graph's base all possible sequences of three spikes (one from each spike train) may be represented. The relative abundance of each possible sequence is plotted vertically above this base. The correlation may be estimated by dividing the base into triangular bins and counting the number of occurrences of a particular sequence that fall within each bin. Three types of graphs may be constructed. The covariance function for the three spike trains represents the rate of occurrence of three spike sequences, the compound renewal-density function represents the effect of one spike on the combined firing of the other two cells, and the simple renewal-density function represents the way by which the firing times of two cells affect the firing rate of the third one. (9 refs.)

73697 Water diffusion and measurement of cerebral blood flow by $C^{15}O_2$ inhalation. M.Steinling, J.C.Baron, F.Soussaline, J.Rousseau, D.Comar, R.Naquet, C.Kellershohn (Dept. de Biologie, CEA, Orsay, France).
Int. J. Nucl. Med. & Biol. (GB), vol.10, no.1, p.17-22 (1983).
Measurement of local cerebral blood flow (CBF) using the $C^{15}O_2$ continuous inhalation technique coupled with positron emission tomography (PET) rests on the assumption that the in vivo labelled water ($H_2{}^{15}O$) of blood diffuses freely within the brain water pool. This requirement, however, may be disputed: in the rhesus monkey, Eichling et al. (1974) showed a linear relationship between the single-pass extraction of water (E) and CBF after intracarotid $H_2{}^{15}O$ injection, such that E decreases as CBF increases. Such a limitation in water transport across the blood brain barrier has also been suggested to exist in man (Paulson, 1977). In order to verify its possible effects on measured CBF in baboons, simple computer analysis was performed comparing the data obtained with CBF values reported in similar experiments, but using a freely diffusible inert gas (^{133}Xe). This allowed calculation of a water extraction index which was shown to decline as CBF increased. This result may be considered as a presumption of the part played by the limited water diffusibility on the final CBF values, but other factors must also be considered, such as the inescapable admixture of grey and white matter (partial volume effect), a limitation of present day PET technology. (15 refs.)

73698 Computerized measurement of tongue dorsum movements with pulsed-echo ultrasound. E.Keller (Univ. du Quebec a Montreal, Montreal, Quebec, Canada), D.J.Ostry.
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1309-15 (April 1983).
A computerized system for the measurement of tongue dorsum movements with pulsed echo ultrasound is described. The presentation focuses on technical and methodological considerations in the on-line acquisition of vertical tongue movement information, its digital processing and display. Problems associated with transducer placement, peak detection, data averaging, and curve fitting are considered, and validation procedures based on X-ray and indicators of measurement reliability are reported. The discussion centers on advantages and disadvantages of the technique and its applications. (30 refs.)

73699 Reflex inhibition procedures for animal audiometry: a technique for assessing ototoxicity. J.S.Young, L.D.Fechter (Div. of Toxicology, Johns Hopkins School of Hygiene & Public Health, Baltimore, MD, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1686-93 (May 1983).
A procedure for making rapid audiometric assessments of animal subjects, based on the ability of weak stimuli to modify the strength of reflexes elicited by subsequently presented strong stimuli is described. Pure-tone detection thresholds for rates and guinea pigs determined by this procedure are quite comparable to those determined by operant techniques, and are similarly sensitive to ototoxic insult. The procedure is also applicable to the assessment of suprathreshold sensory function, and offers advantages over commonly used procedures for assessing ototoxicity. (28 refs.)

73700 A method for combining field potential recording with local perfusion in the hippocampus of the anaesthetized rat. M.L.Errington, A.C.Dolphin, T.V.P.Bliss (Div. of Neurophysiology & Neuropharmacology, Nat. Inst. for Medical Res., London, England).
J. Neurosci. Methods (Netherlands), vol.7, no.4, p.353-7 (April 1983).
A method is described for combining local perfusion of discrete brain areas and simultaneous recording of field potentials using a push-pull cannula with attached electrodes. The authors used a commercially available concentric push-pull cannula (Plastic Products, Clark Electromedical, UK) whose inner and outer tubes were 0.35 and 0.83 mm o.d. One or more Teflon-coated stainless-steel wire recording electrodes (0.1 mm o.d., Clark Electromedical) were glued with epoxy resin to the outer tube of the cannula, and cut so that their exposed tips protruded slightly beyond it. Experiments performed on rats anaesthetized with urethane (1.5 g/kg, i.p.), held in a stereotaxic head-holder are described. (6 refs.)

73701 The identification of pollen grains using cathodoluminescence in the scanning electron microscope. S.Soni (Dept. of Anatomy, Univ. of Toronto, Toronto, Ontario, Canada).
Scanning (Germany), vol.5, no.1, p.45-6 (1983).
A scanning electron microscope fitted with a sensitive cathodoluminescence detector system has been used for the identification of pollen grains stained with acridine orange or unstained. This approach provides a means of identifying and studying the morphological details of pollens. Cathodoluminescence detection can, in principle, extend the limits of resolution beyond those obtainable with the fluorescence microscope. (8 refs.)

73702 Differentiation of Norway maple cultivars with scanning electron microscopy. C.R.Krause (Nursery Crops Res. Lab., US Dept. of Agriculture, Delaware, OH, USA).
Scanning Electron Microsc. (USA), pt.3, p.1151-4 (1982).
Five cultivars of Norway maple, Acer platanoides L., three of which could not be distinguished from one another by conventional techniques, were differentiated using scanning electron microscopy (SEM). From 1977 through 1981, foliage of 1- and 2-year-old field-grown A. platanoides cultivars was collected at Boring, OR, Princeton, NJ and Delaware, OH. SEM analysis of abaxial foliage revealed differences between cultivars in the overall appearance of the stomatal apparatus as manifested by the arrangement of guard cells and stomatal lips. In addition, the presence or absence of nodulations on trichomes was used to separate other cultivars. Cultivar identification using SEM analysis provided images of structures that are unique to each cultivar of Norway maple. Quality control of nursery stock, patent protection and verification of plant reference collections are possible in this species using SEM. (4 refs.)

73703 Preparation and transfer of ultrathin frozen-hydrated and freeze-dried cryosections for microanalysis in scanning transmission electron microscopy. K.Zierold (Max-Planck-Inst. fuer Systemphysiologie, Dortmund, Germany).
Scanning Electron Microsc. (USA), pt.3, p.1205-14 (1982).
A cooling chain preparation technique is described which enables electron microscopy and X-ray microanalysis of biological cells and tissues on an ultrastructural level. Following this method the biological object is quickly frozen without any chemical pretreatment. Sections of about 100 nm thickness are cut at a temperature below 173K in a cryoultramicrotome by means of a dry glass knife and then they are transferred under cold nitrogen gas atmosphere at 120K in a transfer chamber to the electron microscope. After locking the specimen under vacuum into the cold stage of a scanning transmission electron microscope, analysis of structure and elemental distribution is done at 165K. The technique is illustrated by results of yeast cells, rat liver, guinea pig heart muscle and cultured mouse fibroblast cells. The results are discussed with respect to its present limitations and possibilities. (46 refs.)

73704 Subterranean gravity and other deep hole geophysics. F.D.Stacey (Phys. Dept., Univ. of Queensland, Brisbane, Queensland, Australia).
AIP Conf. Proc. (USA), no.96, p.285-97 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).
The early history of the determination of the Newtonian gravitational constant, G, was closely linked with the developments of geodesy and gravity surveying. The current search for non-Newtonian effects that may provide an experimental guide to unification theories has led to the retracing of some of this history. Modern geophysical techniques and facilities, using especially mines and deep ocean probes, permit absolute measurements of G for distance scales up to a few kilometers. Although the accuracy of the very long range determinations cannot equal that of the best laboratory measurements, they are crucial to assessment of the possibility of a scale dependence of G. Preliminary data give values of G on a scale 100-1000 m biased about 1% higher than the laboratory value. Possibilities of systematic error question this apparently significant bias but provide the incentive for better controlled large scale experiments. Several are in progress or under development. A particular difficulty concerns the measurement of in situ density. Even for hard rock, release from overburden pressure causes microcracks and pores to open. Natural pore closure is effective only with deep burial and for this reason there are advantages in deep instrument placement for several geophysical studies. (31 refs.)

73705 Gravimetric terrain corrections in western Canada. J.A.R.Blais, G.D.Lodwick, R.Ferland (Div. of Surveying Engng., Univ. of Calgary, Calgary, Alberta, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.2, p.259-65 (Feb. 1983).
Terrain corrections for gravimetric measurements have been studied in terms of accuracy requirements and automated computations. Geodetic and geophysical applications in western Canada have been considered specifically because of complications arising from the rugged topography. Comparing the computation methods of Nagy and Mathisen in relation to the theoretical results, the former is shown to be more reliable with simulated accidented topography. Other approaches are also briefly discussed and general recommendations are made for an optimal technique to compute gravimetric terrain corrections in western Canada. (13 refs.)

73706 Global isostatic geoid anomalies for plate and boundary layer models of the lithosphere. B.H.Hager (Seismological Lab., California Inst. of Technol., Pasadena, CA, USA).
Earth & Planet. Sci. Lett. (Netherlands), vol.63, no.1, p.97-109 (April 1983).
Isostatic geoid anomalies are usually interpreted using a flat-Earth, one-dimensional idealization. Calculations of model isostatic geoid anomalies for the spherical analogues of the plate and boundary layer thermal models show that the 'over the horizon' effect can bias estimates of geoid slopes by over 20%, although the effect is usually less than 5%. The geoid anomalies for these two models are quite different over old ocean basins, but they are unlikely to be distinguishable on the basis of global geoid observations owing to the presence of other larger perturbations in the geoid. Stripping the effects of plate aging and a hypothetical uniform, 35 km thick, isostatically-compensated continental crust from the observed geoid emphasizes that the largest-amplitude geoid anomaly is the geoid low of almost 120 m over West

Antarctica. This anomaly is a factor of two greater in amplitude than the low of 60 m over Sri Lanka. (38 refs.)

73707 Computing the Sun's position in the sky with an accuracy of 1°. Z.Pokorny.
Energetika (Czechoslovakia), vol.33, no.4, p.140-1 (April 1983). In Czech.
Presents computation of the azimuth and height of the Sun in the sky with an accuracy of 1°, which is sufficient for most engineering applications. Input data are the geographical coordinates of the given location, the date and the time of the day. The computation can be carried out readily by means of programmable calculators (the paper presents complete programs for the type TI-58/59 and H-43C calculators). (no refs.)

73708 The geometric correction of LANDSAT-type imagery using perturbation techniques. I.Levine (General Electric Co., Lanham, MD, USA).
IEEE Trans. Geosci. & Remote Sensing (USA), vol.GE-21, no.2, p.175-9 (April 1983).
A method for geometric correction data calculation is based on decomposition of image distortions into nominal distortions and perturbations, caused by deviations from the nominal spacecraft motion and sensor pointing. The maximal errors of the method are of order of 5 m, and the average errors are less than 0.6 m (σ). (1 ref.)

91.25 GEOMAGNETISM AND PALAEOMAGNETISM; GEOELECTRICITY

73709 Paleomagnetism of the Deadman's Bay diabase dikes from northeastern central Newfoundland. G.S.Murthy (Dept. of Earth Sci., Memorial Univ. of Newfoundland, St. John's, Newfoundland, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.2, p.195-205 (Feb. 1983).
Twenty-six oriented samples were collected from six diabase dikes cutting the Deadman's Bay granite of northeastern central Newfoundland for the purpose of paleomagnetic investigations. The dikes probably form part of a general swarm of diabase dikes in this area of Devonian age. Stepwise thermal demagnetization of individual specimens followed by vector subtraction based on Zijderveld plots revealed two characteristic magnetizations: one, a poorly grouped magnetization of $\bar{D}=220.2°$, $\bar{I}=78.0°$, $\alpha_{95}=17.4°$, $\kappa=16$ carried by multidomain magnetite; and a better grouped magnetization of $\bar{D}=202.9°$, $\bar{I}=4.0°$, $\alpha_{95}=10.0°$, $\kappa=42$ residing in hematite. The poles from diabase dikes of the Gander Zone are discussed in the context of other poles from the northern Appalachians. It is concluded that the Devonian poles from Acadia seem to be displaced relative to the cratonic North American poles for that age. (27 refs.)

73710 Paleomagnetism of diabase dikes from the Bonavista bay area of northeastern central Newfoundland. G.S.Murthy (Dept. of Earth Sci., Memorial Univ. of Newfoundland, St. John's, Newfoundland, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.2, p.206-216 (Feb. 1983).
Paleomagnetic results are reported for a swarm of diabase dikes from the northeastern Gander Zone of the Newfoundland Appalachians. Sixty-eight cores were collected from 19 dikes cutting the various granites and migmatites from the Bonavista Bay area of Newfoundland. From the earlier structural and Rb/Sr age data available, one can infer an age for the dike swarm of between 400 and 330 Ma. Paleomagnetic studies including alternating field and thermal demagnetizations reveal that the swarm can be divided into two groups: group 1 has a characteristic magnetization of $D=296.6°$, $I=82.2°$ with $\alpha_{95}=5.8°$ for $N=14$ dikes with the corresponding pole position at 53.9°N, 77.4°W. One dike's magnetization was found to be reversed relative to the other group 2 dikes. Various magnetic experiments conducted to study the bulk magnetic and remanent magnetic properties of the dike material suggest that their behavior is consistent with multidomain pure magnetic being the dominant magnetic mineral. The group 1 pole position lies close to Newfoundland and is similar to other poles of equivalent age for intrusives from New Brunswick and Newfoundland. Rock units from the southeastern margin of the Iapetus Ocean thus seem to be yielding consistent 'high-latitude' poles, a factor that needs to be taken into account in any discussion of the tectonic evolution of the area. (38 refs.)

73711 Paleomagnetism of the Lac St.-Jean anorthosite and related rocks, Grenville Province, Quebec. K.L.Buchan, W.F.Fahrig, G.N.Freda, R.A.Frith (Geological Survey of Canada, Ottawa, Ontario, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.2, p.246-58 (Feb. 1983).
Alternating field and thermal demagnetization study of the Lac St.-Jean anorthosite and related rock units in the central portion of the exposed Grenville Province reveals two components of magnetization, one of reversed and the other of normal polarity. Both components are thought to have been acquired during the last regional metamorphism, which was sufficiently intense in this area (mostly amphibolite grade) to resent any earlier magnetization. Corresponding paleopoles at 193°W, 8°S (dm=7.3°, dp=4.6°) and 213°W, 19°S (dm=10.5°, dp=8.5°) lie along the 950-900 Ma segment of the recently calibrated Grenville track of the North American apparent polar wander path, a track that has thus far been defined largely by results from rock units of the western Grenville. (35 refs.)

73712 Paleomagnetism of the Borden dykes of Baffin Island and its bearing on the Grenville Loop. K.W.Christie, W.F.Fahrig (Geological Survey of Canada, Ottawa, Ontario, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.2, p.275-89 (Feb. 1983).
Northern Baffic Island is intersected by spectacular swarms of predominantly northwesterly trending diabase dykes. Cross-cutting relationships, K-Ar ages, and paleomagnetic contact tests indicate that these dykes represent at least two other episodes of Hadrynian igneous activity. The Borden dykes were emplaced during the earlier of these episodes. They are about 950 Ma old and have a paleomagnetic pole position of 153.3°E, 26.7°S, $\delta m=8.6°$, $\delta p=6.1°$. The later episode saw the emplacement of the previously defined Franklin dykes, which are about 750 Ma old. The newly defined Borden pole lies at the southern extremity of the Grenville Loop and has an age consistent with poles of similar position that were derived from rocks of the Grenville Province. All of the dykes probably reflect tension acting in an east-northeast—west-southwest direction. The directions of thick northwest trending dykes, which form a considerable angle to that expected from east-northeast tension, are thought to have been controlled by earlier (circa 1200 Ma) fractures of the Borden fault zones. The two main surges of magma may coincide with two periods of Hadrynian uplift in the Boothia Peninsula area to the west. (10 refs.)

73713 Magnetic inclination of basaltic rocks from the East-Pacific Rise at 21 degrees North and validity of polarity criteria. B.Smith (Lab. de Geomagnetisme, Univ. de Paris VI, Saint Maur des Fosses, France).
Can. J. Earth Sci. (Canada), vol.20, no.2, p.322-33 (Feb. 1983). In French.
22 samples have been selected according to macroscopic, oriented criteria (elongation plane of feeder tubes in sheeted lavas, bubbles and gas cavities, stalacites, septa) from which the polarity of a sample, acquired in situ during its cooling, could be established. The natural remanent magnetization intensity of these generally voluminous samples (up to about 350 cm^3) has a mean value of 11.35 ± 2.31 $A.m^{-1}$; the scatter of the values can be explained by the varying proportion of nonmagnetic material (glass, Mn) in the samples. The magnetic viscosity is always negligible and the stability of the remanent magnetization direction after alternating field demagnetization indicates that the stable direction determined is the direction of the original thermoremanence. Despite the relatively low latitude, which makes the occurrence of negative magnetic inclinations within a normal polarity period (Brunhes, in this case) more probable, no reverse polarity has been found. The mean inclination of the 22 samples is $I=+41.8\pm16.7°$ and becomes $I=+42.2\pm19.4°$ if the samples are grouped in 15 pinpoint sampling sites; these values are not significantly different from those of the local dipole field or from those of the actual local field. The scatter of the magnetic inclination values is more tightly bound to the quality of the polarity criteria than to the secular variation of the Earth's magnetic field. It appears from this study that macroscopic polarity criteria may be used in an almost systematic way to find the polarity of an in situ sample. (27 refs.)

73714 Paleomagnetism of Archean volcanics and Proterozoic dikes in La Grande Riviere area of Nouveau-Quebec. M.K.Seguin (Dept. de Geologie, Univ. Laval, Ste-Foy, Quebec, Canada), K.N.M.Sharma, GF.Woussen, K.St.Seymour, D.T.A.Symons.
Can. J. Earth Sci. (Canada), vol.20, no.2, p.339-43 (Feb. 1983).
Paleomagnetic results are reported for six Archean volcanics and six Proterozoic diabase dike sites in the La Grande Riviere basin using AF and thermal demagnetization. The limited geological and statistical data base makes interpretation of the results necessarily tentative. The dikes yield an A component pole at 84°W, 74°N from magnetization residing in higher stability domains, which likely reflects emplacement either at ~2150 or ~1825 or ~1650 Ma ago, and a B component pole at 33°W, 4°S residing in lower stability domains, which likely reflects metamorphism during the Hudsonian Orogeny at ~1725 Ma, or, less likely, during Grenvillian uplift at ~975 Ma. The volcanics appear to yield a prefolding C component pole at 28°W, 49°S that dates extrusion at ~2900 Ma and a postfolding D component pole at 306°W, 37°N that dates metamorphism by the Kenoran Orogeny at ~2600 Ma. (15 refs.)

73715 Paleomagnetism of Late Archean metavolcanics and metasediments, Abitibi orogen, Canada: tholeiites of the Kinojevis Group. J.W.Geissman, D.W.Strangway, A.M.Tasillo-Hirt (Dept. of Geology, Univ. of Toronto, Toronto, Ontario, Canada), L.S.Jensen.
Can. J. Earth Sci. (Canada), vol.20, no.3, p.436-61 (March 1983).
Iron-rich and magnesium-rich basaltic tholeiites of the latest Archean Kinojevis Group, central Abitibi Belt, northeastern Ontario, contain a natural remanent magnetization that is generally multivectorial. The components in all units reside in essentially pure magnetite, not the original titanomagnetites. Any original TRM was lost by chemical reconstitution of the magnetic oxides in response to primary deuteric conditions, long-term burial, regional metamorphism to prehnite-pumpellyite facies, and possibly intrusion by Matachewan dikes. Data from contact tests with Matachewan dikes indicate that the units are indeed capable of retaining a very latest Archean—earliest Proterozoic field. High-coercivity, high-blocking-temperature directions from samples from other flows, and paleomagnetic data from Kinojevis tholeiites are discussed. (82 refs.)

73716 A magnetic profile and inferred seafloor spreading in Foul Bay, Red Sea. M.M.Khattab (Dept. of Geology, United Arab Emirates Univ., Alain, United Arab Emirates).
Earth & Planet. Sci. Lett. (Netherlands), vol.63, no.1, p.110-12 (April 1983).
A profile taken across the aeromagnetic coverage of Foul Bay and the adjacent north Benas Bay indicates seafloor spreading. The best synthetic-to-observed profile fit was for spreading to have occurred, along a NNE axis, between 22 and 5 Ma ago at a rate of 0.5 cm/yr. In this interval extensive basic volcanicity was occurring in eastern Egypt. A nearly continuous spreading phase of this span of time, in a direction parallel to the present-day spreading axis, is suggested. (12 refs.)

73717 The unique solution of the inverse problem in electrical surveying and electric well-logging for piecewise-continuous conductivity. V.L.Druskin (Central Geophys. Expedition, Min. of Petroleum Industry, USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.1 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.1, p.51-3 (1982).
A unique solution is proven for the determination of a conductivity function in a medium consisting of arbitrary regions with constant conductivity and piecewise-smooth boundaries; for a three-dimensional problem in electrical surveying, with the possibility of locating points measurement and supply electrodes at any point on a given portion of the Earth's survey; and for a two-dimensional problem in axisymmetric electric well-logging with the location of measurement and supply electrodes at any point on a given segment on the drill-hole axis. (3 refs.)

73718 Electrical conductivity of the Earth's crust and the upper mantle in Kamchatka, based on data from magnetotelluric logging. Yu.F.Moroz (Eastern Geophys. Trust, Min. of Geology, USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.1, p.54-61 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.1 (1982).
The deep structure is considered for Kamchatka, on the basis of results of magnetotelluric logging carried out in 1970-1978. Three zones are distinguished by different geoelectric profiles for the crust and upper mantle. In these zones are layers of reduced resistivity at depths of 100-150, 30-50, and 8-15 km. The nature of the conducting layers is discussed. The features manifested for the geoelectric profile of the crust and upper mantle find reflection in the tectonics, magmatism, heat field, and hydrothermal activity of the region. (35 refs.)

73719 A Miocene polarity transition (R-N) from the Agno Batholith, Luzon. I.Williams, M.Fuller (Dept. of Geological Sci., Univ. of California, Santa Barbara, CA, USA).
J. Geophys. Res. (USA), vol.87, no.B11, p.9408-18 (10 Nov. 1982). [received: May 1983]
A geomagnetic reversal record has been obtained from the Agno Batholith (16°15'N, 120°39'E) in Luzon Island, the Philippines. This body is a biotite-hornblende quartz diorite dated at between 14.5 and 15.0 m.y. Hysteresis properties show that the magnetic remanence is dominated by multidomain, low-titanium titanomagnetite. A stable component of magnetization is isolated

upon both thermal and alternating field demagnetization. The reversed-to-normal reversal sequence has a far-sided VGP path and a decrease in intensity of magnetization of approximately a factor of 5, with a longer duration than the directional change. The VGP path is confined in a longitudinal band 120° from the site and so differs from the characteristic reversed-to-normal transition paths in that it is not near-sided. The Agno reversal record is consistent with a quadrupole field and reversal initiated in the northern hemisphere. (26 refs.)

73720 Hydromagnetic waves in a differentially rotating sphere. D.R.Fearn, M.R.E.Proctor (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
J. Fluid Mech. (GB), vol.128, p.1-20 (March 1983).
The linear stability of a uniformly internally heated, self-gravitating, rapidly rotating fluid sphere is investigated in the presence of an azimuthal magnetic field $B_0(r,\theta)\hat{\phi}$ and azimuthal shear flow $U_0(r,\theta)\hat{\phi}$ (where (r,θ,ϕ) are spherical polar coordinates). Solutions are calculated numerically for magnetic field strengths that produce a Lorentz force comparable in magnitude to that of the Coriolis force. The critical Rayleigh number R_c is found to reach a minimum here and the qualitative behaviour of the thermally driven instabilities in the absence of a shear flow ($U_0=0$) is similar to that found by earlier workers (e.g. Fearn 1979*b*) for the simpler basic state $B_0=r \sin \theta$. The effect of a shear flow is followed as its strength (measured by the magnetic Reynolds number R_m) is increased from zero. (34 refs.)

73721 The stabilizing role of differential rotation on hydromagnetic waves. D.R.Fearn, M.R.E.Proctor (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
J. Fluid Mech. (GB), vol.128, p.21-36 (March 1983).
The role that differential rotation plays in the hydromagnetic stability of rapidly rotating fluids has recently been investigated by the authors (1983) as part of a wider study related to the geodynamo problem. Starting with a uniformly rotating fluid sphere, the strength of the differential rotation was gradually increased from zero and several interesting features were observed. These included the development of a critical region whose size decreased as the strength of the shear increased. The resolution of the two-dimensional numerical scheme used in the authors' earlier study is limited, and consequently it was only possible to consider small shear strengths. This is unfortunate because differential rotation is probably an important effect in the Earth's core and a more detailed study at higher shear strengths is desirable. The author's are able to achieve this by studying a rapidly rotating Benard layer with imposed magnetic field $\mathbf{B}_0=B_M s\hat{\phi}$ and shear $\mathbf{U}_0=U_M s\Omega(z)\hat{\phi}$, where (s,ϕ,z) are cylindrical polar coordinates. (20 refs.)

73722 Magnetometer arrays and geodynamics. D.I.Gough (Inst. of Earth & Planetary Phys., Univ. of Alberta, Edmonton, Alberta, Canada).
In book: *Evolution of the Earth*, R.J.O'Connell, W.S.Fyfe [Ed.], p.87-95. Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
The use of large two-dimensional arrays of recording magnetometers, to observe time-varying magnetic fields in the period range 15-150 minutes, has led to the discovery and mapping of several large, conductive structures in the crust and upper mantle. In the western United States the observations are well fitted by induced currents flowing in the upper mantle, and the regions of high conductivity correlate well with high heat flow and with seismological evidence of partial melting. A narrow conductor at crustal depths joins the northern end of the Southern Rockies in Wyoming to the Black Hills of South Dakota and to the Wollaston Domain of north central Saskatchewan. In southern Africa two major crustal conductors have been well mapped by four array studies. One conductor revealed a hitherto unrecognized southwestward extension of the Luangwa-Zambezi Rift and saline water in fractures may provide the high conductivity. The other conductor underlies the tip of the continent south of 30°S. (22 refs.)

91.30 SEISMOLOGY

73723 Seismicity induced by surface mining: the Belchatow, Poland, earthquake of 29 November 1980. S.J.Gibowicz, B.Guterch, H.Lewandowska-Marciniak (Inst. of Geophys., Polish Acad. of Sci., Warsaw, Poland), L.Wysokinski.
Acta Geophys. Pol. (Poland), vol.30, no.3, p.193-219 (1982).
On 29 November 1980 a magnitude 4.6 earthquake occurred in the brown coal mining area of Belchatow in central Poland. The seismic moment, source radius and stress drop are considered. The fault plane solution, found from P-wave first motions at twenty-eight stations, is discussed. The depth is estimated. Although the removal of the overburden and drainage of coal deposits by water withdrawal seem to be direct factors responsible for stress concentration, the preexisting tectonic stress is probably the most important indirect factor responsible for the origin of the Belchatow event. (46 refs.)

73724 Periodicity of strong mining tremors in the Lubic copper mine. A.Kijko, M.M.Dessokey, E.Glowacka (Inst. of Geophys., Polish Acad. of Sci., Warsaw, Poland), M.Kazimierczyk.
Acta Geophys. Pol. (Poland), vol.30, no.3, p.221-30 (1982).
The mining tremors recorded in the area of the Lubin copper mine in Poland from 1972 to 1980 are analyzed. The trend of increasing energy of the shocks with time, which appears from the data, is removed. The first and third Gumbel extreme values distribution are applied to estimate the probabilities of occurrence and return periods of tremors with different energies. It is found that the third Gumbel distribution fits the observations better than the first one, similarly for the case of natural earthquakes. The maximum expected energy for the next five years, is calculated with a probability 0.99 using the third Gumbel distribution. (12 refs.)

73725 The velocity anisotropy of rock mass and location accuracy of mining tremors. B.Drzezla, A.Mendecki (Mining Dept., Silesian Tech. Univ., Kosciuszki, Poland).
Acta Geophys. Pol. (Poland), vol.30, no.3, p.231-41 (1982).
One of the main problems in studies of the rock mass state in mines, by seismic and seismoacoustic methods, is the exact location of determination of the seismic events. The methods based on the assumption that the rock mass is an isotropic medium seem to be insufficient, though they are still being improved. The influence of anisotropy intensity and its geometry in the rock mass, with respect to the seismic networks, on the location errors resulting from the use of 'isotropic method' is investigated. (14 refs.)

73726 Interaction of shear cracks in an external stress field. J.Niewiadomski (Inst. of Geophys., Polish Acad. of Sci., Warsaw, Poland).
Acta Geophys. Pol. (Poland), vol.30, no.3, p.243-52 (1982).
Presents calculations for a system of shear cracks in an external stress field. Special attention is paid to the problem of inhomogeneity of the material in which the system of cracks exists. The calculations are useful for an explanation of the spatial distribution of aftershocks. (10 refs.)

73727 Strong motion prediction using mathematical modeling techniques. K.Aki (MIT, Cambridge, MA, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S29-41 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
The purpose of the present paper is to present the state of the art in The purpose of the present paper is to present the state of the art in predicting strong ground motion from the basic understanding of fault mechanics and seismic wave propagation. The mathematical foundation of the current work in this area was firmly established in the early 1960s by Maruyama (1963) and Burridge and Knopoff (1964) who showed that the point-force equivalent of a fault slip is a double couple and the seismogram can be computed by a space-time convolution of slip function with Green's function. The slip function describes the fault displacement during an earthquake as a function of time and position on the fault plane. Green's function here is the response of the Earth when an impulsive double couple is applied at a point on the fault plane. The slip-function and Green's function express quantitatively by the source and the propagation effect, respectively, on seismic motion. (80 refs.)

73728 The empirical prediction of ground motion. D.M.Boore, W.B.Joyner (Office of Earthquake Studies, US Geological Survey, Menlo Park, CA, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S43-60 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
Recent additions to the strong-motion data set, primarily from earthquakes in California and Italy, are responsible for a large number of papers examining the prediction of ground-motion measures using regression methods. Peak acceleration is still the most common measure being considered, but increasing attention is being given to peak velocity and spectral amplitudes. Although direct comparisons among the studies are hampered by differing definitions of distance and magnitude, in general the various studies give similar answers for peak acceleration in the region of distance and magnitude space in which most of the data are concentrated. As might be expected, the differences are most pronounced for large magnitudes and distances close to the fault, where data are few. Even so, widely differing assumptions about the form of the regression equation and differences in the composition and weighting of the data set can give similar answers. A Monte Carlo study shows that the question of whether the shape of the attenuation curves is magnitude-dependent cannot be resolved by existing data. (39 refs.)

73729 Seismic event discrimination. R.R.Blandford (Teledyne Geotech, Alexandria, VA, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S69-87 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
Discrimination of small events begins with detection, association, and location. The author describes recent advances in detection, association and location techniques. The author then discusses earthquake sources mechanisms and compares them to nuclear explosions. The seismic waves radiated by each type of event are considered. The possibility of detecting the type of event from the teleseismic wave field is assessed. (83 refs.)

73730 Test ban treaty verification with regional data—a review. P.W.Pomeroy, W.J.Best, T.V.McEvilly (Rondout Associates Inc., Stone Ridge, NY, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S89-129 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
Summarizes the use of regional ($\Delta \leq 30°$) seismic data in a test ban context for detecting, locating, identifying, and determining the yield of underground nuclear explosions. In many areas of the world *Lg* is the largest amplitude wave recorded on standard seismograph systems and thus is the most appropriate phase for monitoring small magnitude events. Excellent location capability for near-regional events has been demonstrated at the Norwegian small aperture array (NORESS) using *Lg* and *P* waves. *Lg* and other regional phases may contain information on source depth. Fifteen classes of regional discriminants have been identified including 1. First Motion, 2. $M_S{:}m_b$, 3. P^2/P^1 Ratio, 4. Excitation of Short-Period *SH* Waves, 5. *Lg*/*Rg* Amplitude Ratios, 6. *Pn*/*Lg*, *Pg*/*Lg*, and P_{max}/Lg Amplitude Ratios, 7. *Lg* Group Velocity and Energy Ratios in *Lg*, 8. Excitation of *Sn*, 9. Third Moment of Frequency, 10. Generation of Higher Mode Surface Waves, 11. Peak Amplitudes of Love and Rayleigh Waves and Long-Period Surface Wave Energy Density, 12. Prevailing Period of Long-Period Love Waves, 13. Spectral Ratio-Long-Period *S* Waves to Rayleigh Waves, 14. Spectral Ratio-Long Period Love Waves to Rayleigh Waves, 15. Frequency of the Peak Spectral Amplitudes and Spectral Ratios in *Pn*, *Pg*, *S*, and *Lg*. Each of these proposed discriminants has, with differing degrees of success, separated some explosions from some earthquakes. The major conclusion of this study is that a systematic and comparative evaluation of all the proposed regional discriminants is now required, utilizing a common data base derived from all present-day test sites. (104 refs.)

73731 Estimating the yield of underground nuclear explosions. T.C.Bache (Defense Advanced Res. Projects Agency, Arlington, VA, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S131-68 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
This article summarises the current state of understanding of the technical issues involved in the methods employed to estimate the yield of underground nuclear explosions. m_b and M_b data derived from short-period teleseismic P-waves can be used but detailed knowledge of source-region and travel-path differences between known and unknown yield events must be known. (134 refs.)

73732 The effect of attenuation on seismic body waves. V.F.Cormier (Lincoln Lab., MIT, Cambridge, MA, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S169-200 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
Reviews of body-wave attenuation have been conducted from the viewpoint of predicting the regional variation of strong ground motion or from the viewpoint of constructing path corrections to reduce the scatter in network estimates of m_b. Recent reviews include those by Lundquist et al. (1980), Chung and Bernreuter (1981a, b), and Der et al. (1982; unpublished observations) and contributions to a report on the effect of attenuation on yield estimation from m_b (Defense Advanced Research Projects Agency, 1982). This review

will incorporate and synthesize the material of these reviews and attempt to give a balanced appraisal of experimental results. Further research will be suggested for resolving the frequency and regional dependence of attenuation and for reducing the scatter due to attenuation in network estimates of source size using m_b and other measures. (140 refs.)

73733 Application of arrays in the detection, location, and identification of seismic events. F.Ringdal, E.S.Husebye (NTNF/NORSAR, Kjeller, Norway).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S201-24 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
The purpose of this paper is to review the application of seismic arrays to the problem of verifying adherence to a potential comprehensive nuclear test ban treaty. Ever since technical discussions on this subject started in the late 1950s, the focus has been on the problems involved in detecting, locating, and identifying low-magnitude seismic events. In this paper, the concept of seismic arrays, their general objectives and design considerations are discussed. A brief historical survey of array developments to date is provided. The operational aspects of seismic arrays, and the achievements that have been made both in the field of event detection, location, and identification and in general seismological research are reviewed. Finally the likely future developments of the array concept are briefly discussed. (87 refs.)

73734 Body-wave seismograms in inhomogeneous media using Maslov asymptotic theory. C.H.Chapman, R.Drummond (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S277-317 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
Asymptotic ray theory is widely used to describe body waves in inhomogeneous media, but caustics, shadows, critical points, etc. have to be treated as special cases. Unfortunately, these singularities are often the points of greatest interest as they are caused by inhomogeneities in the model. Transform methods, e.g. the reflectivity method and WKBJ seismograms, are used to investigate waves at these singular points but are restricted to laterally homogeneous media. Maslov asymptotic theory uses the ideas of asymptotic ray theory and transform methods, combining the advantages—simplicity and generality—of both techniques. In this paper, Maslov asymptotic theory is developed for the computation of body-wave seismograms. (57 refs.)

73735 Scattering and attenuation. K.Aki (MIT, Cambridge, MA, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S319-30 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
An extensive existence of strong small-scale heterogeneity in the Earth is suggested by the great variability of direct waves and remarkable stability of scattered waves, both in the case of teleseismic *P* coda and in the case of local earthquake *S* coda. Quantitative studies of small-scale heterogeneities have been made by the following three methods. A lower bound of heterogeneity in the lithosphere has been estimated by the deterministic or stochastic modelling of travel-time and amplitude fluctuation of teleseismic *P* waves across a large aperture seismic array. An upper bound of heterogeneity has been estimated by modeling the attenuation of *S* waves as a scattering loss due to heterogeneity. These two approaches suggest the existence of heterogeneity with rms velocity fluctuations from 3 to 10 per cent. The third method is based on the estimation of heterogeneity from the amplitude of coda waves. The author found a significant discrepancy between the result obtained by the third method and those from the first two, and attribute the discrepancy to the assumption of a single-scattering model adopted in the coda generation theory. (43 refs.)

73736 Earthquake prediction—1982 overview. C.R.Allen (California Inst. of Technol., Pasadena, CA, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S331-5 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
Short-term earthquake prediction represents a more difficult scientific problem than was thought 5 yr ago when the National Earthquake Hazards Reduction Program (USA) commenced, and progress has not been as rapid as initially hoped. At this point, reasons can be cited for both encouragement and discouragement. Despite slow progress, the goal of short-term prediction remains realistic, and research should continue vigorously, albeit with some changes in scientific strategy. In contrast, progress in long-term prediction and hazard evaluation has been far more rapid than initially envisaged. (no refs.)

73737 A strategy for short-term prediction of earthquakes. B.Raleigh (Columbia Univ., Palisades, NY, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S337-42 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
Physical processes leading to laboratory rupture have a nonlinear character which justifies optimism that earthquakes are predictable. However, nonlinear effects at the source of a smaller earthquake may be an insufficient basis for the prediction of an earthquake with rupture lengths tens to hundreds of kilometers. Thus, a strategy for predicting such major or great events must depend on knowing the state of readiness of the entire length of the suspect fault. The two most promising avenues are: (1) to search for variations in shear and dilatational strains within the fault zone and in the bordering regions that signify the onset of a Stuart instability; and (2) to follow in detail the seismicity in response to the temporal variations of shear and normal strains as a measure of what parts of a long fault are at the point of failure. An observational strategy based on these physical models requires detailed and frequent to continuous observation of strain within the fault and border zones. Focal mechanisms and accurate locations of earthquakes $M \geq 2$ are needed to relate seismicity to a given configuration of the strain field. (12 refs.)

73738 Earthquake prediction: what we have learned and what we should do now. J.F.Evernden (Office of Earthquake Studies, US Geological Survey, Menlo Park, CA, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S343-9 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
Adopting out of necessity a definition of 'earthquake prediction' which stresses short-term warnings (months, weeks, day, and hours), the author concludes that either current research is doing the wrong things or such predictions may be impossible. Assuming the former, the author recommends major emphasis on direct or nearly direct measurements of stress/strain change in or across fault zones in the immediate vicinity of strong points or 'asperities' (how do you find asperities?). This recommendation presupposes essentially total emphasis of the United States' program in California. Even if this recommendation is unpalatable, it is certain that resources now available require a total reanalysis of the present program and a consequent reallocation of funds. (no refs.)

73739 Variations in seismicity as a fundamental tool in earthquake prediction. K.C.McNally.
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S351-66 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
Refraining from expressing mere opinions, this report attempts to classify and synthesize results of recent seismological studies for earthquake prediction in order to allow the reader to make an independent evaluation of the progress of this program to date. The general conclusion is that significant progress has been made in the research for earthquake prediction during the last 5 yr. Eighty-six references are cited which have been published during this time period. This report is intended as an overview, and the references cited are not a complete list of all works related to the rather broad topic. The reader can obtain detailed references for a particular aspect by referring to the works cited. (136 refs.)

73740 Comparison of earthquake prediction approaches in the Tokai area of Japan and in California. J.F.Davis, P.Somerville (Div. of Mines & Geology, California Dept. of Conservation, Sacramento, CA, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S367-92 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
The Japan Meteorological Agency (JMA) has lead responsibility to predict the anticipated $M8+$ Tokai earthquake which can seriously affect Shizuoka prefecture and environs. The Japan Meteorological Agency maintains a continuous staff observation of records from onshore and offshore seismic stations (events to $M1$), strainmeters, tiltmeters, tide gauges, and ground water conditions. The Earthquake Assessment Committee, composed of six seismologists, has the responsibility to predict the Tokai event based upon this Japan Meteorological Agency data. They expect to provide a short-term prediction with a lead time of hours to several days. The prediction criteria used by the JMA are described. California relies upon the California Earthquake Prediction Evaluation Council and the National Earthquake Prediction Evaluation Council to appraise predictions coming from either government laboratories or university sources. Review of observational data and procedures for making prediction conclusions are more decentralized and informal in California. (30 refs.)

73741 Acoustic waves: a finite difference film. G.McMechan, B.Price (Pacific Geosci. Centre, Earth Phys. Branch, Sidney, BC, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.3, p.506-8 (March 1983).
A finite difference solution of the acoustic wave equation is an ideal basis for making movies since the computations naturally provide a series of frames at successive, discrete time increments. Each time frame contains a picture of the wavefield present at that time. An example is illustrated in a short (~2.8 min) 16 mm film that shows the dynamic response of a two-dimensional model to a point source. The model consists of a layer of varying thickness that overlies a half space. The film shows the point source expanding into a circular wavefront that is reflected, refracted, and diffracted by the model. (3 refs.)

73742 Mapping the Miocene Farallon Ridge jump on the Pacific plate: a seismic line of weakness. E.A.Okal, J.-M.Bergeal (Dept. of Geology & Geophys., Yale Univ., New Haven, CT, USA).
Earth & Planet. Sci. Lett. (Netherlands), vol.63, no.1, p.113-22 (April 1983).
Bathymetric and magnetic data are used to obtain estimates, on the Pacific and Nazca plates, of the boundaries separating lithosphere generated at the old Farallon Ridge from the more recent one created at the present-day East Pacific Rise. An excellent correlation is found with the sites of known teleseismically recorded intraplate seismicity, suggesting that these boundaries, which are lines of age discontinuity in the plate, must be zones of weakness of the lithospheric plate. (30 refs.)

73743 Chronology and development of the 1980 earthquake at El Asnam (Algeria): a postscript. Y.Thommeret (Centre Sci. de Monaco, Monaco), G.C.P.King, C.Vita-Finzi.
Earth & Planet. Sci. Lett. (Netherlands), vol.63, no.1, p.137-8 (April 1983).
Radiocarbon dating has now confirmed the alluvial chronology that was used in assessing the extent of deformation during the 1980 El Asnam earthquake. It also supports the suggestion that earlier movements were related to a hypocentre further to the east. (5 refs.)

73744 An application of syntactic pattern recognition to seismic discrimination. Hsi-Ho Liu, King-Sun Fu (Electrical Engng., Purdue Univ., West Lafayette, IN, USA).
IEEE Trans. Geosci. & Remote Sensing (USA), vol.GE-21, no.2, p.125-32 (April 1983).
Two syntactic methods for the recognition of seismic waveforms are presented. The seismic waveforms are presented by strings of primitives. Primitive extraction is based on cluster analysis. Finite-state grammars are inferred from the training samples. The nearest-neighbor decision rule and error-correcting finite-state parsers are used for pattern classification. While both show equal recognition performance, the nearest-neighbor rule is much faster in computation speed. The classification of real data for earthquake/explosion is presented as an application example. (20 refs.)

73745 Design of matched filters and related frequency selective filters for the detection of teleseismic events. W.W.Stammler (Lehrstuhl fur Nachrichtentech., Univ. Erlangen, Erlangen, Germany).
IEEE Trans. Geosci. & Remote Sensing (USA), vol.GE-21, no.2, p.133-40 (April 1983).
Matched filters and related frequency selective filters are designed for the automatic detection of weak teleseismic earthquake signals. After a presentation of alternative design procedures, practical aspects of the filter realization are discussed. Simulation results indicate significant SNR gain. (13 refs.)

73746 A comparison of synthetic p-tau sections for proposed models of two ophiolites. T.M.Brocher, W.C.Kempner, J.F.Gettrust (Hawaii Inst. of Geophys., Univ. of Hawaii, Honolulu, HI, USA).
J. Geophys. Res. (USA), vol.87, no.B11, p.9355-64 (10 Nov. 1982). [received: May 1983]
Analyses of slant stacks of synthetic record sections generated from velocity models for ophiolites by the reflectivity method show that even 90-km-long refraction lines having a 10-Hz source and a 1-km intertrace spacing barely distinguish between fine-scale crustal structures which are of current interest. Such data are sufficient, however, to distinguish between young and old oceanic crust. Tripling the spatial sampling period degrades the quality of the synthetic slant stacks for this temporal frequency content. A major implication of the study is that most currently available field data, being sparser and poorer in quality (due to both noise and instrument responses), offer little hope of resolving thin low-velocity layers or small changes in velocity gradients by using newly proposed inversion techniques based on slant stacking. Last, a simple, first-order correction to a downward continuation algorithm,

namely the inclusion of the phase shift caused by postcritical reflection at each ray parameter, is proposed. (49 refs.)

73747 Rapid F-K migration of zero offset marine reflection data. J.A.Carter, L.N.Frazer (Hawaii Inst. of Geophys., Univ. of Hawaii, Honolulu, HI, USA).
J. Geophys. Res. (USA), vol.87, no.B11, p.9365-73 (10 Nov. 1982). [received: May 1983]
Recently developed frequency-wave number migration algorithms have made it possible to migrate digitally recorded zero-offset reflection data economically. The greatest contributions to the speed of these methods lie in the well-known symmetries of the Fourier transform and the assumption of a constant velocity section. In this paper the authors address some of the problems that can arise when F-K migration is used on single channel (or stacked multichannel) reflection data. These problems include incorrect phase shifts caused by use of a two-dimensional method to treat data gathered in a three-dimensional world, overmigration and undermigration because of errors in the velocity function used to migrate, spatial aliasing due to an insufficient density of shots or receivers, and the effects of automatic gain control when applied before migration. (18 refs.)

73748 Computation of theoretical SH seismograms with a finite source. E.Mantovani (Osservatorio Geofisico Univ. di Siena, Siena, Italy), E.Boschi.
Nuovo Cimento C (Italy), vol.5C, ser.1, no.5, p.528-36 (Sept.-Oct. 1982). [received: May 1983]
Generates complete theoretical seismograms, which include both body and surface waves, for realistic sources buried in a radially heterogeneous, anelastic, spherical Earth. The effect of the source finiteness on the time series is investigated by simulating rupture propagation along a fault plane with a series of point sources distributed along a straight line. On the time series, this source model seems to produce, by increasing the time duration of the rupture, a broadening of the body wave bursts, a shortening of the time lag between the phases *S* and *sS*, and a decrease in the amplitude of body waves relative to surface waves. (15 refs.)

73749 The structure, density, and homogeneity of the Earth's core. B.A.Bolt, R.A.Uhrhammer (Seismographic Station, Univ. of California, Berkeley, CA, USA).
In book: *Evolution of the Earth*, R.J.O'Connell, W.S.Fyfe [Ed.], p.28-37. Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
Some recent independent results on the structure and physical state of the core are compared. Despite recent refinements, the present resolution of the P and S velocity gradients places considerable limitations on the sharpness of inferences on dynamical properties, density stratification and deviations from adiabatic conditions. 91.35 EARTH'S INTERIOR STRUCTURE AND PROPERTIES

73750 Optical properties of the Earths mantle: refraction of temperature radiation. S.Maj (Inst. of Geophys., Polish Acad. of Sci., Warsaw, Poland).
Acta Geophys. Pol. (Poland), vol.30, no.3, p.253-60 (1982).
The molecular refraction of temperature radiation in the Earth's mantle is derived. The calculations are based on the Lorentz electron theory of solids. The characteristic frequency of elementary electron oscillators is identified with the energy gap of a solid. The assumption is that solid material related to the Earth's mantle obeys Birch's law and its energy gap is about 9 eV. (10 refs.)

73751 Some aspects of tectonic history of the Holy Cross Mountains in the light of palaeomagnetic studies. M.Lewandowski (Inst. of Geophys., Polish Acad. of Sci., Warsaw, Poland).
Acta Geophys. Pol. (Poland), vol.30, no.3, p.261-77 (1982).
Selected upper palaeozoic and lowest mesozoic sedimentary rocks from the western part of the Holy Cross Mountains were palaeomagnetically analyzed. Thermal and AF cleaning revealed the presence of several characteristic remanent magnetizations of both pre-folding and secondary origin. The directions roughly coincide with the zone of appearance of characteristic directions for the Russian platform and the Eurasia continent. The palaeomagnetic dating of the secondary directions shows that, generally, they are not younger than the Triassic, thus post-dating some fold structures of uncertain age. Stable Late-Mesozoic overprints are not observable, which may be a consequence either of a smaller thickness of the Mesozoic cover than that estimated today, or of a changed paleo-heat-flow in the Holy Cross Mountains area at the end of the Mesozoic. (24 refs.)

73752 Tectonic significance of Cameron's Line in the vicinity of the Hodges Complex—an imbricate thrust model for western Connecticut. C.Merguerian (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).
Am. J. Sci. (USA), vol.283, no.4, p.341-68 (April 1983).
Cameron's Line is a major tectonic boundary in the western part of the core zone of the New England Appalachians. It separates metamorphosed shelf and transition-zone rocks to the west from eugeosynclinal rocks to the east. In western Connecticut it separates the Waramaug Formation from the Hartland Formation and is marked by a zone of structural discordance characterized by intense localized folding (F_2), transposition of structures, truncation of Hartland subunits, and shearing under metamorphic conditions. The Hodges Complex, which engulfs Cameron's Line in northwestern Connecticut, is a small mass of pyroxenite, hornblendite, gabbro, and diorite. The Hodges pluton is not sheared or offset along Cameron's Line. Rather, a narrow, statically recrystallized contact aureole with coexisting cordierite-kyanite-staurolite-biotite-garnet is overprinted on the fold-fault fabric (S_2). The intrusion, therefore, postdated isoclinal folding, early metamorphism, and the development of Cameron's Line. Thus, it is unlikely that this mafic-ultramafic mass is an ophiolite despite its occurrence at a major tectonic boundary. Cameron's Line is interpreted as a ductile fault that developed at the deep levels of a west-facing Taconic accretionary prism. Other aspects of the tectonics of this area are discussed. (59 refs.)

73753 The southern Caspian: a compressional depression floored by a trapped, modified oceanic crust. M.Berberian (Dept. of Earth Sci., Bullard Labs., Univ. of Cambridge, Cambridge, England).
Can. J. Earth Sci. (Canada), vol.20, no.2, p.163-183 (Feb. 1983).
The south Caspian intracontinental depression, floored by oceanic basement, is a relatively stable block, with minor deformation, surrounded by active fold-thrust belts of accurate form (Talesh, Alborz, and Kopeh Dagh Mountains), which have undergone intense late Cainozoic crustal shortening. The basin is interpreted as a Neogene-Quarternary 'compressional depression', bounded by multi-role mountain-bordering reverse faults, and apparently floored by a late Palaeozoic-Triassic or late Mesozoic-early Tertiary 'modifed oceanic crust' trapped along an old geosuture. The author describes the detailed crustal structure of this area and discusses the tectonic history. (155 refs.)

73754 U-Pb geochronology of the Bokan Mountain peralkaline granite, southeastern Alaska. B.De Saint-Andre, J.R.Lancelot (Dept. des Sci. de la Terre, Univ. des Sci. et Tech. du Lanquedoc, Montpellier, France), B.Collot.
Can. J. Earth Sci. (Canada), vol.20, no.2, p.236-45 (Feb. 1983).
The Bokan Mountain arfvedsonite-aegirine granite is the only peralkaline acid intrusion actually known on the margin of the Canadian Cordillera. It is the end product of a peralkaline magmatic evolution and is characterized by genetically associated concentrations of U and Th. The U-Pb method on zircons has been used to date two samples: one from a barren peralkaline granite and one from a low-grade U-Th mineralized albitite. A typological study has revealed two genetically different populations of zircons in the barren granite. The upper intercept age of 171 ± 5 Ma obtained on a concordia diagram dates the emplacement of the peralkaline granite. A Jurassic period of magmatic activity must be integrated into the geological history of Prince of Wales Island. Peralkaline magmatism may have occurred when the Alexander Terrane rifted away from its more southerly area of origin. (37 refs.)

73755 Chronology of tectonothermal activity in the western Avalon Zone of the Newfoundland Appalachians. R.D.Dallmeyer (Dept. of Geology, Univ. of Georgia, Athens, GA, USA), E.M.Hussey, S.J.O'Brien, C.F.O'Driscoll.
Can. J. Earth Sci. (Canada), vol.20, no.3, p.355-63 (March 1983).
The Ackley granite was intruded into variably deformed and metamorphosed rocks within the Gander and Avalon Zones of the Newfoundland Appalachians. Biotite and hornblende from the pluton record internally concordant $^{40}Ar/^{39}Ar$ age spectra that define total-gas dates of 352-356 Ma. These indicate relatively rapid post-magmatic cooling, a feature consistent with the post-kinematic character of the pluton. In the western Avalon Zone, recrystallized, sericitic metavolcanic rocks from the Late Precambrian Love Cove and Marystown Groups display variably discordant, whole-rock $^{40}Ar/^{39}Ar$ age spectra. However, the samples yield well defined plateau ages of 353-400 Ma (11 samples), which are interpreted to closely date the regional metamorphism and associated deformation in the western Avalon Zone. This chronology is similar to that of the easternmost Gander Zone, indicating that deformation and metamorphism in the western Avalon Zone occurred simultaneously with tectonic juxtaposition of the Gander and Avalon terranes during the Acadian Orogeny. (52 refs.)

73756 Trace-element mobility during low-grade metamorphism and silicification of basaltic rocks from Saint John, New Brunswick. J.Dostal (Dept. of Geology, Saint Mary's Univ., Halifax, NS, Canada), D.F.Strong.
Can. J. Earth Sci. (Canada), vol.20, no.3, p.431-5 (March 1983).
Upper Carboniferous basaltic lavas from Saint John, New Brunswick were metamorphosed under prehnite-pumpellyite conditions and some were also affected by extensive silicification. Silicification led to simple dilution of relatively immobile elements such as rare earths, Y, Zr, Hf, Th, and Sc. The chrondrite-normalized REE patterns of the silicified rocks are parallel to those of basalts. (16 refs.)

73757 Landward flow in the upper mantle: effects of the heat sink and viscous coupling of the sinking slab. M.Rabinowicz, B.Lago, M.Souriau (GRGS/CNES, Toulouse, France).
Earth & Planet. Sci. Lett. (Netherlands), vol.63, no.1, p.76-88 (April 1983).
Regional studies landward of a trench show that gravity anomalies are low compared with those expected from a cold sinking slab and that residual depth anomalies are strongly negative at distances up to 1200 km from the trench. It is shown that flow models taking simultaneously account of the viscous coupling and of the cooling effect of the sinking slab are able to explain these facts: the viscous coupling being related only to observed data down to 400 km from the trench, while the cooling effect mainly explains data at larger distances from the subduction zone. (25 refs.)

73758 Density inhomogeneities under island arcs systems. M.Ye.Artem'yev, V.N.Strakhov, M.I.Lapina, L.M.Tokar'.
Izv. Acad. Sci. USSR Phys. Solid Earth (USA), vol.18, no.1, p.1-17 (1982).
Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.1 (1982).
On the basis of data obtained from studies of deep seismic sounding type, models of the Earth's crust across the Kurile, Bonin, Mariana and Greater Antilles (Puerto Rico) island arcs are constructed. The calculated gravity effect of these models is eliminated from the observed gravity anomaly profiles. The residual anomalies obtained vary within the limits of ±250 mgal. Using a selection method, two fundamentally different density models obtained which satisfy the residual anomaly field with high accuracy. An attempt is made to solve the problem of choosing one of the two models by using a special combination of interpretation methods. The surface of the high

density mantle and the low density zone are discussed. The residual gravity anomalies are explained. (28 refs.)

73759 A geothermal model of the lithosphere and a map of the thickness of the lithosphere on the territory of the USSR. V.Cermak (Geophys. Inst., Acad. of Sci., Prague, Czechoslovakia).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.1, p.18-27 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.1 (1982).
A layered model of the Earth's crust and upper mantle is considered in which the vertical distribution of the thermal conductivity is given in accordance with experimental data for rocks as function of temperature. It is assumed that radiogenic heat generation in the crust decreases with depth according to an exponential law. In the mantle the radioactivity does not vary with depth: down to a depth of 120 km it corresponds to a dunite-peridotite composition, while below this it corresponds to pyrolyte. For this model generalized temperature curves are calculated for which the parameter is the heat flow on the surface. An interpretation of geothermal data enables one to determine the thickness of the lithosphere. The method is applied to the heat flow field on the territory of the USSR. A map of the regional distribution of the thickness of the lithosphere is constructed. (46 refs.)

73760 Finite amplitude tidal waves at the interface between two fluid saturated porous media. M.Venkatachalappa, R.Sekar, N.Rudraiah (Dept. of Math., Central Coll., Bangalore Univ., Bangalore, India).
Indian J. Pure & Appl. Math., vol.14, no.2, p.207-21 (Feb. 1983).
The propagation of finite amplitude tidal waves at the interface between two semi-infinite fluid saturated porous media of different densities with the external constraint of rotation is investigated using both analytical and numerical methods. The set of non-linear partial differential equations governing the wave motion have been reduced to the set of non-linear ordinary differential equations using a suitable integral. From this set, the phase portraits are obtained. The analytical results, obtained by neglecting the residue integral show that the periodic tidal waves exist in the case of a fluid saturated porous medium only for small values of porous parameter. When the governing non-linear wave equations are integrated directly, the authors found that the tidal waves are almost periodic for small values of porous parameter. The important conclusions are: (i) The Coriolis force has a significant effect on wavelength which is useful in the study of abnormality in the interior of the Earth. (ii) The effect of porous parameter in the presence of rotation is to make the waves periodic only for small values of porous parameter and its effect is to reduce the amplitude of the waves, due to the dampening effect of Darcy's resistance. (11 refs.)

73761 A kinematic thermal history of the Earth's mantle. R.T.Langan (Dept. of Geological Sci., Northwestern Univ., Evanston, IL, USA), N.H.Sleep.
J. Geophys. Res. (USA), vol.87, no.B11, p.9225-35 (10 Nov. 1982). [received: May 1983]
Kinematic convection models of the Earth's thermal history are computed assuming that subducted slabs, along with some entrained material, sink all the way to the core-mantle boundary. The temperatures within the lithosphere and within the mantle away from sinking slabs are computed assuming that the return flow from the core-mantle boundary to the surface can be considered as slow, vertical advection. In the models, a drop in asthenospheric temperature occurs near the end of the Archean when subducted material first returns to the surface. This drop is about 200°C if the subducted material does not mix thermally with the mantle on its way down and if only a thin thermal layer exists at the core-mantle boundary. The possibility that this temperature drop is an explanation for the transition between Archean and Proterozoic tectonic styles is considered. An implication of the kinematic scheme is that the asthenospheric temperature increases gradually during the Archean until the cooler material reaches the surface. After the Archean, the thermal evolution is similar to a well-mixed model. (57 refs.)

73762 Permafrost, heat flow, and the geothermal regime at Prudhoe Bay, Alaska. A.H.Lachenbruch, J.H.Sass, B.V.Marshall, T.H.Moses,Jr. (US Geological Survey, Menlo Park, CA, USA).
J. Geophys. Res. (USA), vol.87, no.B11, p.9301-16 (10 Nov. 1982). [received: May 1983]
Temperature measurements through permafrost in the oil field at Prudhoe Bay, Alaska, combined with laboratory measurements of the thermal conductivity of drill cuttings permit an evaluation of in situ thermal properties and an understanding of the general factors that control the geothermal regime. A sharp contrast in temperature gradient at $\sim$600 m represents a contrast in thermal conductivity caused by the downward change from interstitial ice to interstitial water at the base of permafrost under near steady state conditions. Interpretation of the gradient contrast in terms of a simple model for the conductivity of an aggregate yields the mean ice content ($\sim$39%), and thermal conductivities for the frozen and thawed sections. These results yield a heat flow of $\sim$1.3 HFU, the anomalously deep permafrost is a result of the anomalously high conductivity of the siliceous ice-rich sediments. Curvature in the upper 160 m of the temperature profiles represents a warming of $\sim$1.8°c of the mean surface temperature and a net accumulation of 5-6 kcal/cm^2 by the solid Earth surface during the last 100 years or so. Rising sea level and thawing of ice-rich sea cliffs probably caused the shoreline to retreat tens of kilometers in the last 20000 years, inundating a portion of the continental shelf that is presently the target of intensive oil exploration. (40 refs.)

73763 Structure and origin of the J Anomaly Ridge, western North Atlantic Ocean. B.E.Tucholke (Woods Hole Oceanographic Instn., Woods Hole, MA, USA), W.J.Ludwig.
J. Geophys. Res. (USA), vol.87, no.B11, p.9389-407 (10 Nov. 1982). [received: May 1983]
The J Anomaly Ridge is a structural ridge or step in oceanic basement that extends southwest from the eastern end of the Grand Banks. It lies beneath the J magnetic anomaly at the young end (M-4 to M-0) of the M series magnetic anomalies. Its structural counterpart beneath the J anomaly in the eastern Atlantic is the Madeira-Tore Rise, but this feature has been overprinted by post-middle Cretaceous deformation and volcanism. In order to study the tectonic origin and evolution of the J Anomaly Ridge-Madeira-Tore Rise system, the authors obtained seismic refraction and multichannel reflection profiles across the J Anomaly Ridge near 39°N latitude. (63 refs.)

73764 Pb-Sr isotope variation in Indian Ocean basalts and mixing phenomena. B.Dupre, C.J.Allegre (Dept. des Sci. de la Terre, Univ. Pierre et Marie Curie, Paris, France).
Nature (GB), vol.303, no.5913, p.142-6 (12 May 1983).
Pb and Sr isotopic compositions from the Indian Ocean (active ridges, old ocean floor, and seismic ridge samples) confirm the characteristic nature of the mantle record in this region. The results emphasize the importance of mixing processes between the lower mantle (oceanic-island basalt source), and the upper mantle (ridge-basalt source). The isotopic characteristics of the Indian Ocean islands seem to be in agreement with the hypothesis of the reinjection of sediments into the mantle. (32 refs.)

73765 Hot springs on the ocean floor. J.M.Edmond, K.Von Damm.
Sci. Am. (USA), vol.248, no.4, p.70-85 (April 1983).
A sign of the volcanic activity that mints new oceanic crust, they nourish strange forms of life and lay down great deposits of ore. They also help to explain the chemical content of the sea. (no refs.)

73766 A global geochemical model for the evolution of the mantle. D.L.Anderson (Seismological Lab., California Inst. of Technol., Pasadena, CA, USA).
In book: *Evolution of the Earth*, R.J.O'Connell, W.S.Fyfe [Ed.], p.6-18. Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
A geochemical model of the mantle is presented which incorporates different compositions above and below the 670 km seismic discontinuity. The upper mantle transition region is assumed to be eclogite or olivine eclogite. The rest of the upper mantle is assumed to be garnet peridotite or pyrotite. Mantle convection patterns and early differentiation are computed using these assumptions. In this model plate tectonics is intermittent. At a depth of 150-220 km the continental thermal anomaly triggers kimberlite and carbonatite activity, alkali and flood basalt volcanism, vertical tectonics and continental breakup. Hotspots remain active after the continents leave, building the oceanic islands. Mantle plumes rise from a depth of about 220 km. Midocean ridge basalts originate in the depleted layer below this depth. Material from this layer may also be displaced by subducted oceanic lithosphere to form back-arc basin magmas. (60 refs.)

73767 Temperature profiles in the Earth. O.L.Anderson (Dept. of Earth & Space Sci., Univ. of California, Los Angeles, CA, USA).
In book: *Evolution of the Earth*, R.J.O'Connell, W.S.Fyfe [Ed.], p.19-27. Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
A geotherm from 80 to 5153 km depth is proposed. The temperature gradient in the upper mantle is found by using laboratory data on minerals in conjunction with seismic travel-time curves. The temperature at the beginning of the transition zone, 380 km, is taken to be 1400°C, following the results of the phase transitions in olivine. The lower mantle temperature gradient is found by assuming adiabatic compression and taking γ to be γ_a (gamma acoustic). A small correction is made for the effect of apparent superadiabaticity (100°) throughout the lower mantle. The temperature gradient of the outer core is found by assuming adiabatic compression and by taking T to be constant (γ=1.4). An estimate for the ΔT jump at thermal barriers at 670 km and 2885 km depth is needed. The result gives 4080K at the inner-outer core boundary. The results are compared with several current thermal models of the Earth. (32 refs.)

73768 Deep crustal structure: implications for continental evolution. L.D.Brown, J.E.Oliver, S.Kaufman, J.A.Brewer, F.A.Cook, F.S.Schilt, D.S.Albaugh, G.H.Long (Dept. of Geological Sci., Cornell Univ., Ithaca, NY, USA).
In book: *Evolution of the Earth*, R.J.O'Connell, W.S.Fyfe [Ed.], p.38-52. Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
Current concepts of the deep crust beneath the continents as compositionally heterogeneous and structurally complex represent a major refinement of earlier approximations of crustal structure as relatively simple two or three layer sequences of 'granitic' over 'gabbroic' rock. The increased recognition of the complexity of deep crustal structure has resulted in large part from the use of advanced seismic sounding methods. The authors describe how deep seismic reflection and refraction studies such as COCORP have contributed to the present knowledge of deep crustal geology. The early phases of continental evolution studied by these methods include extensional tectonics, transform faulting, compressional tectonics and plate boundary areas. (67 refs.)

73769 Mineral deposits as guides to supracrustal evolution. R.W.Hutchinson (Dept. of Geology, Univ. of Western Ontario, London, Ontario, Canada).
In book: *Evolution of the Earth*, R.J.O'Connell, W.S.Fyfe [Ed.], p.120-40. Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
Evolutionary changes in major types of mineral deposits from Archean to Recent time provide guides to the main events and sequence of Earth's supracrustal tectonic evolution and related processes. Evolutionary changes through time in ferruginous sedimentary rocks reflect a changing source of iron through geologic time and also oxygenation of the oceans about 2.2 b.y. ago. Differences between nickel deposits in Archean, Proterozoic and Phanerozoic rocks may be due to evolutionary changes in crust-mantle thickness and mantle composition. Other types of mineral deposits studied include lode gold deposits, massive base-metal sulphide deposits and uranium deposits. The Archean greenstone belt was studied. The supracrustal sequences took place under reducing conditions. The relevance of past continental mass distribution and plate tectonics is also studied. (114 refs.)

73770 On the mechanism of the gravitational differentiation in the inner Earth. V.P.Keondjan (P.P. Inst. of Oceanology, Acad. of Sci., Moscow, USSR).
In book: *Evolution of the Earth*, R.J.O'Connell, W.S.Fyfe [Ed.], p.167-95. Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
The gravitational differentiation of the Earth's interior leads to the formation of the Earth's core. Qualitative consideration shows the possibility of gravitational instability due to separation of matter within the layers of the core-mantle boundary. The result of such an unstable process is convective motion in the body of the mantle. This process is connected with density inversion of nonthermal origin. Construction of a mathematical model of this phenomenon based on multicomponent fluid dynamics is a necessity. Such a model is described. (21 refs.)

73771 The role of oxidation-reduction reactions in the Earth's early history. O.L.Kuskov (Vernadsky Inst. of Geochem. & Analytical Chem., Acad. of Sci., Moscow, USSR).
In book: *Evolution of the Earth*, R.J.O'Connell, W.S.Fyfe [Ed.], p.196-209. Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
Thermodynamical analysis of oxidation-reduction reactions for the undifferentiated Earth in the early stage of its evolution has been carried out. The possibility of reduction of ferromagnesian silicates, magnesiowustite, magnetite, and stishovite by carbon in the closed and in the open systems at very high pressures has been considered. It is shown that the processes of reduction in the closed system are thermodynamically forbidden. Calculations of thermal effects of oxidation-reduction reactions in the open systems have been carried out. The results of calculations show that a change in sign of the thermal effect occurs in the open system at a certain critical pressure on the solid phases. Calculations of ΔH for several reactions which are important for the thermal history of the Earth are presented at pressures up to 2 Mbar and the change in temperature for the undifferentiated Earth are estimated. The

data show that the central part of the Earth and the deep interior could become warm due to reduction processes. The reducing conditions in the early history of the Earth during the core formation imply that a large fraction of chemical reaction heat was released in the central part of the Earth. (45 refs.)

73772 **Terrestrial heat flow history and temperature profiles.** E.A.Lubimova, O.Parphenuk (Inst. of Phys. of Earth, Moscow, USSR).
In book: *Evolution of the Earth*, R.J.O'Connell, W.S.Fyfe [Ed.], p.217-28. Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
Discusses the global patterns amd magnitude of heat flow through the crust. Using this information the thermal history of the Earth is studied. An empirical exponential negative relationship between crustal heat flow and the latest geotectonic event exists for oceanic and continental lithospheres with simple structure. On this basis heat flow observations may give information on (i) an energy pulse due to core-mantle segregation, (ii) large astronomical body impacts on the early Earth, (iii) mantle convection. These problems are studied in this article by use of a numerical model. Earth interior geotherms are produced. (65 refs.)

91.45 PHYSICS OF PLATE TECTONICS

73773 **The Jurassic Basin in the Maritime Alps (France): palaeogeography, tectonic control and later deformations.** G.Dardeau (Univ. de Nice, Nice, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.8, p.661-4 (28 Feb. 1983). In French.
During the Jurassic, the Maritime Alps basin was settled in a peculiar location, i.e. where the 'Brianconnais', 'Dauphinois' and 'Provencal' realms merged together. In its geological history the main episodes preceding and accompanying the oceanic opening of the Ligurian branch of the Tethys can be found: rifting, then downwarping and deepening of the continental margins which are expressed by two successive sedimentary patterns. The palaeogeographic trends are characterized by the occurrence, southwards, of a smoothly uneven land surface—the Corsico-Sardinian block—along which deposit areas narrow near the 'Brianconnais' domain. Subsequent tectonic deformations follow the same pattern, already defined during the Jurassic, with small-side displacements. (12 refs.)

73774 **Paleomagnetic constraints on the Late Cretaceous and Cenozoic tectonics of southeastern Asia.** J.Achache, V.Courtillot, J.Besse (Inst. due Phys. du Globe, UER de Sci. Phys. de la Terre, Paris, France).
Earth & Planet. Sci. Lett. (Netherlands), vol.63, no.1, p.123-36 (April 1983).
Reviews the relevant paleomagnetic data for the Late Mesozoic and Cenozoic and compares them with the predictions of the 'propagating extrusion tectonics' model and, more generally, to put constraints on future tectonic models of the area. (44 refs.)

73775 **Analysis of states of stress between provinces of constant stress.** A.McGarr (US Geological Survey, Menlo Park, CA, USA).
J. Geophys. Res. (USA), vol.87, no.B11, p.9279-88 (10 Nov. 1982). [received: May 1983]
Recent studies have indicated the existence of crustal provinces or domains within which the state of stress shows little apparent horizontal variation. Between provinces the state of stress may undergo substantial changes, often over remarkably short distances. As analyzed here, the transition in stress state between adjacent domains is caused by shear tractions acting on the base of the elastic-brittle layer and is mediated by a stress field within a zone between the provinces that can be determined by solving the equations of force equilibrium and stress compatibility. The component of horizontal stress oriented perpendicular to the provincial boundary changes smoothly across the transition zone from one province to the other, whereas the horizontal stress oriented parallel to the boundary shows smaller but discontinuous changes. The horizontal component of shear stress is unlikely to change from one province to another because of the implausible nature of the required basal traction; thus, in this regard, states of stress in adjacent domains appear to be coupled. The coincidence of a number of stress transition zones with boundaries defined by heat flow suggests that in many cases the basal tractions are the result of thermally induced mass transport below the elastic-brittle layer in the direction of increasing horizontal compressive stress. (41 refs.)

73776 **Recomputation of vertical crustal motions near Palmdale, California, 1959-1975.** S.R.Holdahl (Nat. Geodetic Survey, Nat. Ocean Survey, Rockville, MD, USA).
J. Geophys. Res. (USA), vol.87, no.B11, p.9374-88 (10 Nov. 1982). [received: May 1983]
Vertical motion in the Palmdale region has been reassessed by simultaneous least squares adjustment of the networks formed by the corrected observations. The new results show 7.5±4.0 cm of apparent upward movement at Palmdale. Part or all of the 7.5 cm might be attributable to residual systematic error. The great concern associated with Palmdale, if based on motion calculated from leveling data, does not seem warranted. Castle's (1976) original result was strongly influenced by a single level route to Palmdale. Refraction error accumulates rapidly on this route because of the long gentle slope and the location of sightings over railroad ballast where vertical temperature gradients are unusually large. (18 refs.)

73777 **Tectonic influences on sedimentation, Early Cretaceous, East Flank Powder River Basin, Wyoming and South Dakota.** R.J.Weimer (Colorado School of Mines, Golden, CO, USA), J.J.Emme, C.L.Farmer, L.O.Anna, T.L.Davis, R.L.Kidney.
Q. Colorado Sch. Mines (USA), vol.77, no.4, p.1-61 (Oct. 1982). [received: April 1983]
Recurrent movement of basement fault blocks in the east-central Powder River Basin has controlled thickness variations and the distribution of porous and permeable reservoir sandstone within Lower Cretaceous strata. A depositional model, incorporating tectonic and sea level adjustments, illustrates that both marine and nonmarine units thicken in structurally low (graben) areas and thin over structural high (horst) areas. (37 refs.)

73778 **Radiogenic isotopes and crustal evolution.** D.J.DePaolo (Dept. of Earth & Space Sci., Univ. of California, Los Angeles, CA, USA).
In book: *Evolution of the Earth*, R.J.O'Connell, W.S.Fyfe [Ed.], p.59-68. Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
Recent studies of the geochemical evolution of the continent crust using radiogenic isotopes of Sr, Nd and Pb have clarified many aspects of the origin and history of the crust. The times of formation of crustal rocks from the mantle can be determined with relative ease using Nd isotopes, which should allow a more accurate description of the age and growth history of the continents to be constructed. Comparison with the Moon suggests that the absence of congenital crust on the Earth is due either to efficient recycling of the crust during the first billion years or to a cataclysmic destruction of the crust about 3.8-4.0 AE ago. The formation of new crust has involved a considerable amount of reconstitution of preexisting crust in the Phanerozoic, but in contrast, Archean crust appears to have been almost purely mantle-derived. There is increasing evidence of gross chemical layering in the crust which forms within a few hundred million years after the formation of new crust from the mantle. Other aspects of isotope geochemistry and the history of the crust are considered. (43 refs.)

73779 **Intraplate stress orientations from Alberta oil-wells.** J.S.Bell, D.I.Gough (BP Canada Ltd., Calgary, Alberta, Canada).
In book: *Evolution of the Earth*, R.J.O'Connell, W.S.Fyfe [Ed.], p.96-104. Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
Many oil-wells in Alberta are noncircular as a result of spalling of their walls. Such break-outs occur over a wide depth range covering the stratigraphic column from Devonian through Cretaceous. The azimuths of greatest elongations are given by modern four-arm dipmeter logs, and are tightly grouped in a northwest-southeast direction. They are unrelated to dip of the strata. The observed break-out orientations would require the larger horizontal principal stress to be directed northeast-southwest, normal to the Rocky Mountains fold axes. As a normal stress field (σ_1 vertical) would give horizontal stresses too small to produce break-outs at depth of a few hundred metres, it is believed that σ_1 is horizontal and NE-SW. In the present paper, new break-out orientation data are added, and hydraulic fracturing data are examined. The possible causes for the observed stress field are considered. (23 refs.)

73780 **Plate tectonic patterns and convection in the Phanerozoic.** E.R.Kanasewich, M.E.Evans, J.Havskov (Dept. of Phys., Univ. of Alberta, Edmonton, Canada).
In book: *Evolution of the Earth*, R.J.O'Connell, W.S.Fyfe [Ed.], p.147-66. Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
Paleomagnetic observations, oceanic magnetic lineations, and the present continental margins are combined in an interactive computer program to generate maps for seven periods in the Phanerozoic Era. By using geological evidence on the position of geosynclines, volcanic assemblages, and zones of diastrophism an attempt is made to model a reconstruction of major plate boundaries in the past. During the Cambrian and Ordovician. Periods the continental segments were as widely dispersed as at present and formed a ring of plates on the paleoequator. In these, as in other periods, there is symmetry about the spin axis. Extensive plate motion occurred at about the time of the Caledonian Orogeny. Toward the end of the Cretaceous Period a more dispersed form began to develop yielding the present pattern. The mantle convection patterns throughout this time are discussed. (75 refs.)

73781 **Surface plates and thermal plumes: separate scales of the mantle convective circulation.** W.R.Peltier (Dept. of Phys., Univ. of Toronto, Toronto, Canada).
In book: *Evolution of the Earth*, R.J.O'Connell, W.S.Fyfe [Ed.], p.229-48. Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
The whole mantle convection hypothesis follows naturally from the inference using post-glacial rebound data that there is no dramatic increase of viscosity with depth in the mantle. If convection fills the entire mantle then those properties of the circulation which are accessible to direct measurement are easily explicable in terms of the same scaling laws which govern high Rayleigh and Prandtl number convection in the laboratory. The viscosity con-

trasts which exist across the thermal boundary layers appear to exert no active influence on the flow, apart from stabilizing the top boundary layer (lithosphere) against secondary convective instability and destabilizing the bottom boundary layer adjacent to the core-mantle interface. Destabilization of the bottom boundary layer, which is observed using seismic methods as the D″ region, may lead to the formation of thermal plumes which rise so rapidly to the base of the lithosphere that their ascent is almost adiabatic. Temperature dependent viscosity therefore leads to the observed style of mantle convection which is dominated by two widely separated spatial scales associated respectively with surface plates and thermal plumes. 91.50 MARINE GEOLOGY AND GEOPHYSICS

73782 **Hudson Bay river sediments and regional glaciation. II. Comparison of carbonate mineralogy of size fractions for ice movement inference.** J.D.Adshead (Terrain Sci. Div., Geological Survey of Canada, Ottawa, Ontario, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.2, p.305-12 (Feb. 1983).
For pt.I see ibid., vol.20, no.2, p.290-304 (1983). The application of stream sediment data to problems of local or regional mineralization in glaciated areas requires knowledge of the compositional modifications that accompany the transition from bedrock to glacial drift and from drift to fluvial sediment. Differential abrasion of mineral constituents plays an important role in altering the source rock composition at all stages during this transition. To study the effects of differential abrasion on fluvial sediments in the Hudson Bay area, the mineralogy of the silt and clay fractions of river muds from the west side of Hudson and James Bays is compared with the mineralogy of river sands (Adshead 1983) from the same area. (14 refs.)

73783 **A multitracer approach to the study of erosion in the northeast equatorial Pacific.** D.Kadko (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).
Earth & Planet. Sci. Lett. (Netherlands), vol.63, no.1, p.13-33 (April 1983).
Erosion of sediment at two sites within the siliceous-clay province of the northeast equatorial Pacific is investigated by examining radionuclide, radiolarian and percent smectite profiles of three box cores. A numerical box model of the sediment is presented that examines the effect of various particle rain rates, erosion rates and biological mixing parameters on these profiles. (38 refs.)

73784 **Hydrothermal manganese oxide deposits from Galapagos mounds, DSDP Leg 70, hole 509B and 'Alvin' dives 729 and 721.** C.Lalou, E.Brichet, C.Jehanno, H.Perez-Leclaire (Centre des Faibles Radioactivites, CNRS/CEA, Gif-sur-Yvette, France).
Earth & Planet. Sci. Lett. (Netherlands), vol.63, no.1, p.63-75 (April 1983).
During DSDP Leg 70, a 1.60 m thick manganese oxide layer was sampled in hole 509B. This deposit is formed of alternating layers of hard plates of pure todorokite, about 2 mm thick, and of a more powdery material deeply impregnated with manganese oxide, about 3 mm thick. A SEM study of the plates and the associated powder shows that the powdery material is a transformation of a pre-existing sediment, while the plates are a direct precipitation from a hydrothermal solution. The uranium series disequilibrium method was used to determine the ages of the plates. They are found to be in good chronological sequence and in accordance with the sedimentation rate of the area (4.9 cm/10^3 years) which implies that they have been formed at the sediment-seawater interface during a pulsed injection of hydrothermal solution. The powder presents systematically an 'older age' which is explained by a slowing down of the injection while the normal sediment settles; the older age is due to the ^{230}Th excess of the sediment. (30 refs.)

73785 **Marine geology of the Hess Rise. II. Basement morphology, sediment thickness, and structural geology.** L.W.Kroenke, K.Nemoto (Hawaii Inst. of Geophys., Univ. of Hawaii, Honolulu, HI, USA).
J. Geophys. Res. (USA), vol.87, no.B11, p.9259-78 (10 Nov. 1982). [received: May 1983]
For pt.I see ibid., vol.86, no.B11, p.10734-52 (1981). The basement morphology and sediment thickness of the Hess Rise, an oceanic plateau in the central North Pacific, have been mapped on the basis of seismic reflection profiles. The acoustic stratigraphy on and around the rise is correlated with the lithostratigraphy at Deep Sea Drilling Project sites 464, 310, 465, and 466. A total sediment isopach chart of the rise reveals small-scale departures from the expected sedimentary pattern (thick sediment in shallow areas; thin sediment in deep areas). Sediment-filled basement depressions result from mass transport. A pre Senonian sediment isopach chart shows a thickening from less than 50 m to more than 250 m of sediment from the northeast to the southwest. This trend seems explainable only in terms of the time-transgressive nature of seafloor formed at a mid-ocean ridge. The axial trend of the rise (N30°W) parallels nearby Mesozoic magnetic lineations and seems to be isochronous as deduced from the Deep Sea Drilling Project data. The Hess Rise began developing in late Aptian time along a segment of the Pacific-Farallon Ridge. Important events in the history of the rise include late-stage volcanism on the southern margin of the rise along the Mendocino Fracture Zone, tectonism and volcanism about 85 Ma that resulted in a major regional nonconformity (reflector C). (56 refs.)

73786 **Acoustic backscattering from the basin and margins of the Arctic Ocean.** I.Dyer, A.B.Baggeroer, J.D.Zittel, R.J.Williams (Dept. of Ocean Engng., MIT, Cambridge, MA, USA).
J. Geophys. Res. (USA), vol.87, no.C12, p.9477-88 (20 Nov. 1982). [received: May 1983]
Sound waves created by high-energy explosives were used to measure reverberation and backscattering in the Arctic Ocean. From an ice camp in the Beaufort Sea, signals were backscattered from the continental margin and other major features of the basin. An acoustic array was used to analyse the signals in azimuth. Based on these data the authors constructed charts of normalised backscatter level, which can be compared with known topography of the Arctic Ocean. The resolution of this technique is about 8° in azimuth, 15 km in radial extent, and 1 km in depth. Interpretable signals were obtained out to 2700 km. For 1000 km or less, the backscatter charts provide continuous coverage of the margins and major submerged features. Strong returns from about 73.2°N, 139.0°W indicate one or more prominent features that many contemporary topographic charts do not show. Other strong returns are evident from the Northwind Escarpment and from the continental slopes of Alaska and the Canadian Archipelago. (39 refs.)

73787 **Settling velocity distribution of natural aggregates.** N.Hawley (Dept. of Atmospheric & Oceanic Sci., Univ. of Michigan, Ann Arbor, MI, USA).
J. Geophys. Res. (USA), vol.87, no.C12, p.9489-98 (20 Nov. 1982). [received: May 1983]
An analysis of previous experimental determinations of aggregate settling rates for particles <100 μm in diameter shows that these particles fall significantly more quickly than Stokes' law predicts, with the deviations being most pronounced for smaller particles. This implies that previous sediment flux calculations which have used a form of Stokes' law to obtain aggregate velocities may have significantly underestimated the contribution from the smaller aggregates. The measured fall velocity distributions are described as the sum of normally distributed populations (four for the lacustrine data, two for the marine) whose means, standard deviations and weights have been determined. Because of the increased settling velocities and the use of a distribution of velocities for a given particle size, collisions due to differential settling rates are the governing nonbiological process in the formation of natural aggregates. 91.60 PHYSICAL PROPERTIES OF ROCKS AND MINERALS

73788 **Discrete single-domain and pseudo-single-domain titanomagnetite particles in silicic glass of an ash-flow tuff.** J.W.Geissman, N.G.Newberry, D.R.Peacor (Dept. of Geological Sci., Univ. of Michigan, Ann Arbor, MI, USA).
Can. J. Earth Sci. (Canada), vol.20, no.2, p.334-8 (Feb. 1983).
Single-domain and pseudo-single-domain titanium-poor magnetite grains are present in silicic vitrophyre glass of an ash-flow tuff from western Nevada. Conventional transmission electron microscopy and analytical electron microscopy corroborate inferences, made solely from rock magnetic and remanence data, that the thermoremanent magnetization in the vitrophyre is carried by such grains. The magnetite grains vary in size, shape, and distribution throughout the glass. They probably crystallized during violent eruption and welding of the ash flow, at temperatures well in excess of 600°C. (25 refs.)

73789 **Equilibrium conditions at phase boundaries between elastic bodies.** M.A.Grinfel'd (A.Yu. Schmidt Earth Phys. Inst., Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.1, p.28-33 (1982).
Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.1 (1982).
The conditions of heterogeneous equilibrium of elastic (liquid, solid, gaseous) phases are studied with the aid of the Gibbs' (1950) principle. Two types of interfacial boundaries are distinguished: coherent boundaries and slip boundaries. The former serve to model a contact between solid elastic phases. The latter model interfacial boundaries, when one of the phases is a liquid or a gas. (20 refs.)

73790 Stress magnitudes in natural rock salt. N.L.Carter, F.D.Hansen, P.E.Senseny (RE/SPEC Inc., Rapid City, SD, USA).
J. Geophys. Res. (USA), vol.87, no.B11, p.9289-300 (10 Nov. 1982). [received: May 1983]
Subgrain sizes have been determined for Avery Island domal salt that was deformed experimentally at pressures in the range 3.4 to 20.7 MPa, temperatures from 100° to 200°C, and constant mean principal stress differences of from 2.0 to 20.3 MPa. The subgrain size decreases systematically with increasing stress, independent of temperature, according to the relation $d=190\ \sigma^{-1}$, which is in substantial agreement with the work of others on single crystals and polycrystals of synthetic rocksalt. For two-stage creep experiments it is observed that while subgrain size decreases upon increasing the stress, it does not increase upon lowering the stress. Thus the stresses deduced for seven naturally deformed bedded, domal, and anticlinal rocksalts, 0.5-1.1 MPa, reflect maximum stress differences experienced. The results are applied briefly to considerations of steady state flow during the growth of salt diapirs. (43 refs.)

73791 Elastic moduli, thermal expansion, and inferred permeability of two granites to 350°C and 55 megapascals. H.C.Heard, L.Page (Geosci. Div., Lawrence Livermore Nat. Lab., Livermore, CA, USA).
J. Geophys. Res. (USA), vol.87, no.B11, p.9340-8 (10 Nov. 1982). [received: May 1983]
The coefficient of thermal linear expansion α, Young's modulus E, and bulk modulus K have been determined for the Westerly and Stripa granites to temperatures T of 350°C and pressures P to 55 MPa. Using conventional triaxial apparatus, displacement measurements were made on three samples from each of three orthogonal directions for both rocks. Comparison of the directional values at any P, T, and those from the nine-sample population indicated that within experimental precision, both granites are isotropic in E, K, and α. Both E and K for both rocks decreased with T and increased with P in nonlinear fashion. From 19° to 350°C, E decreased by as much as a factor of 2 and K decreased by 2 to 3 times, depending on P. From 6 to 55 MPa, E increased by factors of 3 to 6 and K increased by 3 to 5, depending on T. Values for α were neither constant nor a monotonic function of P or T. (41 refs.)

73792 Elasticity of pyroxenes: effects of composition versus crystal structure. D.J.Weidner (Dept. of Earth & Space Sci., State Univ. of New York, Stony Brook, NY, USA), M.T.Vaughan.
J. Geophys. Res. (USA), vol.87, no.B11, p.9349-53 (10 Nov. 1982). [received: May 1983]
The variation of elastic moduli among five pyroxenes exhibiting three crystal structures is generally small. The variations that do exist are related to structural differences. C_{11} is most sensitive to compositional changes on the basis of a mechanical structural analog. Its small variation among these pyroxenes suggests that the compositional range reflected by these samples (enstatite, bronzite, diopside) does not affect the elastic moduli. C_{33} is most sensitive to structural perturbations. The large variation of C_{33} (20%) implies that the small variations in crystal structure dominate the variations in elastic moduli. (16 refs.)

73793 Gem materials, natural and artificial. I.Sunagawa (Inst. of Mineralogy, Petrology & Economic Geology, Tohoku Univ., Sendai, Japan).
In book: *Current topics in materials science. Vol.10*, E.Kaldis [Ed.], p.353-497. Amsterdam, Netherlands: North-Holland (1982), vi+515 pp. [0 444 86321 4]
The author summarises the present understanding of gem materials, both natural and laboratory-produced. A comparison is made to see how they are similar or dissimilar in their properties, and to understand why physical properties of the same species can be different between natural and artificially produced gem materials. 91.65 GEOPHYSICAL ASPECTS OF GEOLOGY, MINERALOGY AND PETROLOGY

73794 Sedimentology of Upper Ordovician—Silurian sequences on New World Island, Newfoundland: separate fault-controlled basins?. R.J.Arnott (Dept. of Geology & Mineralogy, Oxford Univ., Oxford, England).
Can. J. Earth Sci. (Canada), vol.20, no.3, p.345-54 (March 1983).
Remapping of northeast New World Island, Newfoundland demonstrates that two major faults separate three distinct sedimentary sequences. Paleontology and sedimentology indicate that these sequences are partly equivalent in age but were deposited in separate basins of deposition that were adjacent to each other. The author describes the stratigraphy, sedimentology, and structure of these sequences and shows how faulting throughout the Early Silurian (Llandovery) influenced sedimentation by uplifting blocks of Caradoc and older rocks between distinct Llandovery troughs. (18 refs.)

73795 Morphometry of open rock basins, Kananaskis area, Canadian Rocky Mountains. D.J.Sauchyn, J.S.Gardner (Dept. of Geography, Univ. of Waterloo, Waterloo, Ontario, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.3, p.409-19 (March 1983).
Digital elevation data have been obtained for 54 open rock basins from aerial diapositives using an analytical stereoplotter. The term 'open rock basin' is used to distinguish these basins from the closed rock basins of classical glacial cirques. The morphometric analyses are based on nine indices: length, width, area, relief, length/width, length/relief, width/relief, area/relief, and compactness. Cluster analysis of compactness and area/relief data indicates five distinct clusters of open rock basins, which are attributed to variations in topoclimate and geologic structure. The three largest clusters are labelled rockfall chutes, rockfall funnels, and open cirques. The cirque cluster is compared with glacial cirques for which published morphometric data exist. (26 refs.)

73796 Depositional environments along a carbonate ramp to slope transition in the Silurian of Washington Land, North Greenland. J.M.Hurst, F.Surlyk (Gronlands Geologiske Undersogelse, Copenhagen, Denmark).
Can. J. Earth Sci. (Canada), vol.20, no.3, p.473-99 (March 1983).
During the earliest Silurian, subsidence and tilting of a relatively flat carbonate platform produced a homoclinal carbonate ramp transitional to the slope of a deep-water basin. Further subsidence, associated with a flexure, differentiated the slope from the carbonate ramp. Subsequently, a linear reef tract developed along part of the flexure, producing a steep reef-scarp slope at the outer homoclinal carbonate ramp margin and accentuating the initial basin slope. Isolated reefs also developed on the slope. The reef tract, marked the transition from the shallow homoclinal carbonate ramp facies to the deeper slope environments. Sedimentation patterns along the incipient slope are discussed. With continued subsidence and differentiation of slope and ramp, slumping of carbonate blocks occurred at the ramp margin. Disorganized talus wedges developed as circular fringes around reefs on the slope, and a fine-grained talus wedge developed along the base of the main precipitous reef scarp at the ramp margin. A large channel cut down and across the slope and eventually became choked with ramp-margin reef and top-of-slope material. Finally, abrupt subsidence drowned all reefs and the slope became essentially starved of resedimented carbonate debris. (77 refs.)

73797 Discovery of striated calcareous concretions in the Gentilly Till of Saint Laurent, Quebec. M.Lamothe (Dept. of Geology, Univ. of Western Ontario, London, Ontario, Canada), C.Hillaire-Marcel, P.Page.
Can. J. Earth Sci. (Canada), vol.20, no.3, p.500-5 (March 1983). In French.
The discovery of striated calcareous concretions in the Gentilly Till supports the hypothesis of an early episode of carbonate precipitation in a glaciolacustrine environment that occurred before the St. Lawrence Lowlands became covered by the last ice advance. Finite ^{14}C ages have been obtained on two such concretions. These ages are in agreement with several others obtained previously on concretions from Lake Deschaillons varves. They suggest a maximum age of ca. 35000 BP for the Gentilly Till deposition. Inasmuch as the underlying St. Pierre sediments have been dated at ca. 75000 BP, the St. Lawrence Lowlands would have been ice-free during a large part of the Wisconsinan stage. (17 refs.)

73798 Synthetic cyclic stratigraphy. D.L.Turcotte, R.J.Willemann (Dept. of Geological Sci., Cornell Univ., Ithaca, NY, USA).
Earth & Planet. Sci. Lett. (Netherlands), vol.63, no.1, p.89-96 (April 1983).
A harmonic variation in sea level is superimposed on a constant velocity of tectonic subsidence in order to generate synthetic cyclic stratigraphy. Maximum rates of sedimentation and erosion are considered. The age dependence and water depth of the resulting cyclic stratigraphy is determined. The results are compared with cyclic sedimentation in the Pennsylvanian age sediments in northwestern Kansas. Spatial variations of synthetic cyclic stratigraphy can be used to generate synthetic seismic stratigraphy. (8 refs.)

91.90 OTHER TOPICS IN SOLID EARTH GEOPHYSICS

73799 Cemented horizon in subarctic Alaskan sand dunes. G.W.Cox, W.T.Lawrence (Dept. of Biology, San Diego State Univ., San Diego, CA, USA).
Am. J. Sci. (USA), vol.283, no.4, p.369-73 (April 1983).
A thin petrocalcic horizon occurs in the Great Kobuk Sand Dunes of western subarctic Alaska. This cemented layer probably formed in late Wisconsin time by the leaching of carbonates in the original sand and in subsequently deposited loess and has been exposed by recently renewed dune field activity. (12 refs.)

73800 On one-dimensional calculations of motions in an explosion in weak two-dimensional problems. A.V.Zabrodin, V.V.Kadet, L.A.Pliner, I.F.Podlivayev, V.I.Selyakov.
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.1, p.45-50 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.1 (1982).
The possibility of applying one-dimensional techniques to studying two-dimensional problems in gas-dynamics, is examined. For the problem concerning an underground explosion in a layer, the characteristic difference in the results of two-dimensional and one-dimensional calculations, is demonstrated. The upper estimate of the difference between the two-dimensional and unidimensional calculations is found analytically. The class of problems for which the estimate obtained holds, is indicated. A comparison between the theoretical estimate obtained by the author and the actual calculated difference is made. (9 refs.)

73801 Classification of arid geomorphic surfaces using Landsat spectral and textural features. E.H.H.Shih (Dept. of Geosci., Univ. of Arizona, Tucson, AZ, USA), R.A.Schowengerdt.
Photogramm. Eng. & Remote Sensing (USA), vol.49, no.3, p.337-47 (March 1983).
A computationally efficient texture extraction algorithm which measures the local edge amplitude and density of an image is used to derive textural features from Landsat MSS data. Three of these derived textural features are added to the original four Landsat bands in a multifeature geomorphic classification of a natural arid terrain. The addition of textural features significantly improved training class separability when compared to a spectral only classification. Classification improvement, as determined by photointerpretation and by comparison to geologic/geomorphic map, was significant. (30 refs.)

73802 Geo-acoustic models for propagation modelling in shallow water. D.M.F.Chapman, D.D.Ellis (Defence Res. Estab. Atlantic, Dartmouth, Nova Scotia, Canada).
Can. Acoust./Acoust. Can. (Canada), vol.11, no.2, p.9-24 (April 1983).
Acoustic propagation in shallow water is viewed as a guided-wave phenomenon, with the sea surface and seabed forming the boundaries. At sub-kilohertz frequencies, the acoustic properties of the seabed to a depth of several wavelengths can have a strong effect on propagation. The computer modelling of propagation requires estimates of such parameters as sound speed, density, attenuation, and layer thicknesses, which are collectively called the geo-acoustic model of the seabed. Direct measurement of these quantities is difficult, and methods must be devised to infer these values from other experiments, often employing acoustic techniques. At DREA, the authors have adopted the approach of independently determining as many geo-acoustic parameters as possible, and adjusting the less precisely known parameters within reasonable limits to effect an agreement between theory and experiment. To this end, they have used sub bottom vertical reflection profiles to determine sediment types and thicknesses, large and small scale seismic refraction experiments to estimate sound speeds, and processing of sub-bottom reflection data to estimate volume attenuation. Examples of geo-acoustic models and comparisons with experiment are presented for shallow water sites on the Scotian Shelf and the southwestern approaches to the English Channel. (20 refs.)

73803 Evolution of liquid and solid discharges of a sub-boreal estuary: St. Jean river, Quebec (north coast of Gulf of St. Lawrence). D.Cataliotti-Valdina, B.F.Long (INRS-Oceanologie, Rimouski, Quebec, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.2, p.184-94 (Feb. 1983). In French.
The hydrodynamics of the St. Jean River estuary, particularly the flow dynamics, was evaluated and the mixing mechanisms were studied for fluvial water-marine water. In order to realize this objective, two series of measurements were undertaken on the solid and liquid discharges: the first took place during the spring flood (May 1980), the latter in conditions of lowest level spring tide (August 1980). The average stream discharge is 1035 m^3/s during floods and 85 m^3/s at periods of lowest water level. When the stream discharges exceed 160 m^3/s, the wedge of salt water is pushed out of the estuary and no reversed currents are present; there is only a reduction of current velocity at the mouth of the river. The quantities of solid particles in suspension vary from 96 mg/L during floods (65-95% mineral matter) to 4.6 mg/L for lowest water levels (58% mineral matter). The general behaviour of the St. Jean River estuary suggests a new type of environment, the subboreal estuaries. (20 refs.)

73804 On the effect of bathymetry in numerical storm surge simulation experiments. B.Johns (Dept. of Meteorology, Univ. of Reading, Reading, England), P.C.Sinha, S.K.Dube, U.C.Mohanty, A.D.Rao.
Comput. & Fluids (GB), vol.11, no.3, p.161-74 (1983).
A numerical model is described for the simulation of storm surges which uses a non-uniform off-shore grid-spacing adjacent to coastal boundaries. This permits an increased resolution near the coast in the models previously described. Using data on the 1977 Andhra cyclone, which struck the east coast of India, it is shown that the near-coastal bathymetry is critical in determining the coastal surge-induced sea-surface elevation. It is also shown that the coastal surge response is effectively independent of the depth of water in the deepest regions of the analysis area. Conclusions are drawn concerning the selection of an optimum resolution in the numerical scheme together with the proper representation of the bathymetry. (10 refs.)

73805 Recent changes in sea level and their possible causes. T.P.Barnett (Scripps Instn. of Oceanography, Univ. of California, San Diego, La Jolla, CA, USA).
Clim. Change (Netherlands), vol.5, no.1, p.15-38 (1983).
A new analysis of 'global' sea level is made that largely avoids the space/time bias of previous works. A coherent pattern of increasing relative sea level (RSL) is found to exist on average at all stations analyzed between 1903-1969. Subject to considerable assumptions, the rate of RSL increase associated with this pattern was 15 cm/century. A similar analysis of the period 1930-1975 again showed RSL increasing on average everywhere except in the western half of the North Pacific Ocean. Potential causes of the RSL change are investigated: approximately equal melting of Greenland/Antarctica, change in sea surface temperature, thermal expansion of the oceans, Earth rotation variation, ocean circulation and/or subsidence along all the coastal margins. (58 refs.)

73806 Orientational effects in geophysical fluid dynamics. N.V.Bagriantsev, A.I.Danilov, V.O.Ivchenko (Arctic & Antarctic Res. Inst., Leningrad, USSR), V.N.Nikolaevsky.
Int. J. Eng. Sci. (GB), vol.21, no.7, p.725-39 (1983).
The approach, accounting for the interaction between essentially different scales of turbulent fluid motions on a rotating sphere, is developed. Representation of the large-scale oceanic circulation as a turbulent flow with orientational effects due to synoptic (mesoscale) eddies is the basis of this technique. The scale of these eddies is much less than that of the considered problem, their energetic significance however is important. Such representation leads to employment of nontrivial angular momentum equation, i.e. to micropolar or asymmetrical hydrodynamics. It allows one to define a function which would characterize the averaged vorticity of mesoscale (subgrid) motions and does not relate to the mean flow vorticity. Using this parameterization, the calculations with barotropic and 2-layer global ocean models have been carried out. The model results do show an increase of basic ocean gyre transports. (35 refs.)

73807 Rays and local modes in a wedge-shaped ocean. J.M.Arnold (Dept. of Electrical & Electronic Engng., Univ. of Nottingham, Nottingham, England), L.B.Felsen.
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1105-19 (April 1983).
Conventional normal mode theory cannot be applied to the nonseparable problem of wave propagation in an ocean with sloping bottom. For small bottom slopes, the sound field may be expressed approximately in terms of adiabatic modes, but this description fails when a mode propagating upslope passes through cutoff. An alternative solution by ray acoustics, valid at high frequencies, contains many multiply reflected contributions, and also undergoes difficult trapped to leaky ray transitions upslope. To address these transition problems, the conventional ray solution is used as a convenient starting point for collective treatment of ray fields and their conversion into local modes. First, the ray fields are generalized by associating with each ray trajectory from source to observer a bundle of local plane waves that is multiply reflected between the boundaries and remains valid also in the transition regions. When the generalized ray series is subjected to Poisson summation and subsequent asymptotics on the transform integrals, it is found to furnish local modes which coincide with the conventional adiabatic modes where these exist. The local mode integrals also yield transition functions which smoothly continue an originally trapped adiabatic mode through cutoff to the leaky regime. The transition behavior agrees with that found by Pierce [J. Acoust. Soc. Am. 72, 523-531 (1982)] by an entirely different approach, and with that predicted by the spectral Green's function method of Kamel and Felsen [J. Acoust. Soc. Am. 73, 1120-1130 (1983)]. The utilization of rays and local modes in each step of the analysis grants physical insight and therefore clarifies the mechanism of propagation in this range-dependent environment. (13 refs.)

73808 Spectral theory of sound propagation in an ocean channel with weakly sloping bottom. A.Kamel, L.B.Felsen (Dept. of Electrical Engng. & Computer Sci., Polytech. Inst. of New York, Farmingdale, NY, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1120-30 (April 1983).
Spectral representations based on the theory of characteristic Green's functions (resolvents) have been used effectively for studying sound propagation in a coordinate separable ocean environment. Such representations are generalized to accommodate weak nonseparability as represented by a homogeneous water channel separated from a homogeneous sediment by a gradually and monotonically sloping bottom. The generalization involves the use of adiabatic invariants for the spectral integration variable and of symmetrizing factors in order to insure that the Green's function, so expressed, reduces by residue calculus to the conventional adiabatic trapped mode expansion whenever that is valid. However, subject to ignoring coupling between the adiabatic modes, the generalized Green's function contains all of the spectral information (discrete and continuous) for upslope propagation from a source to arbitrary observation points in the water or the bottom, and it can be used to derive ray, hybrid ray-mode, and other formulations in this configuration. Numerical evaluation of the spectral integral and comparison with results obtained independently by the parabolic equation algorithm have confirmed its validity for a typical range of observer locations. Asymptotic considerations have been employed to clarify the mechanism of adiabatic mode transition from trapped to radiating in terms of lateral and leaky waves, and to reduce the spectral integral to a simpler canonical transition function similar to those of Pierce [J. Acoust. Soc. Am. 72, 523-531 (1982)] and of Arnold and Felsen [J. Acoust. Soc. Am. 73, 1105-1119 (1983)] which were derived by entirely different methods. (8 refs.)

73809 Low-frequency propagation in almost fluid sediments: role of gravity and other stresses. I.Tolstoy.
J. Acoust. Soc. Am. (USA), vol.73, no.4, p.1200-4 (April 1983).
Relatively unconsolidated sediments of low rigidity μ are common in oceans. Shear modes of low velocity $c_s (c_s \leq 100\ ms^{-1})$ then exist in sea floor sediments, as well as slow boundary waves of velocity $\nu < c_s$ at the water-sediment interface (Stoneley modes). Both have been observed in shallow water experiments at frequencies in the 1-5 MHz band [Rauch, Bottom-Interacting Acoustics (Plenum, New York, 1980)]. In poorly consolidated sediments of this kind ($\mu < 10^9$ dyn cm^{-2}) gravity and other stresses introduce small corrections to the propagation velocities. The role of gravity is of two sorts. On the one hand it introduces buoyancy forces and internal gravity waves—these are negligible for frequencies above 10^{-1} Hz; on the other, it introduces hydrostatic stresses which primarily affect the velocity of shear modes in the sediment—leading to corrections of order $\rho g z/\mu$ (for an overburden of height z in a sediment or sediment+water column of mean density ρ). While the latter measurably affects propagation speeds in sediments, it is an isotropic effect which, in practice, finds itself lumped with other mechanisms of velocity stratification. Interesting and in principle more easily diagnosed in experiments are the effects of anisotropic stress fields—e.g. tensions and compressions associated with gravity slumping mechanisms on slopes and, for deeper and somewhat more consolidated sediments, with forces of local origin such as island loading or tectonic stresses. These can introduce measurable anisotropies into the propagation of various low-frequency bottom associated modes. (18 refs.)

73810 Long-range Atlantic acoustic multipath identification. G.R.Legters (Government Communications Systems Group, Harris Corp., Melbourne, FL, USA), N.L.Weinberg, J.G.Clark.
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1571-80 (May 1983).
Multipath data from three long-range (900 km) transmissions are examined. Two of the transmissions follow similar tracks, with one ending in the Gulf Stream at the receiving end. The third, which is substantially free of Gulf Stream influence, has been extensively studied by Spiesberger et al. [ibid., vol.67, p.2011-2017 (1980)]. The path structure of the transmission crossing the Gulf Stream was characterized by low S/N and appeared to be unstable. Path identification with ray calculations was attempted for the two transmission channels exhibiting stable multipath with success for the major features of the path structures. Excessive smoothing of the sound-speed profile which eliminates the influence of the Atlantic 18° water in the upper layers is shown to degrade the identification of early arrivals. The slight curvature of the ocean sound-speed profile around 4 km of depth also was critical to early arrival identification. The effect of weak range dependence was small while the effect of a gradual sloping bottom near one receiver was significant. (18 refs.)

73811 Acoustic ocean with a propagation in the poro-elastic bottom. T.Yamamoto (Ocean Engng. Div., Rosenstiel School of Marine & Atmospheric Sci., Univ. of Miami, Miami, FL, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1587-96 (May 1983).
The acoustic normal modes in a homogeneous ocean overlying a homogeneous porous elastic bottom half-space are obtained in closed form. The Biot theory is used to model the bottom. The effects of sediment properties of the dispersion and attenuation of acoustic waves are examined numerically. It is found that the shear modulus and the poro-viscous-frequency number $k_s f/\beta\nu$ are the two most critical bottom parameters for acoustic attenuation. Here, k_s is

permeability, f is frequency, β is porosity, and ν is the kinetic viscosity. For sediment and rocks having shear modulus larger than 5×10^7 N/m^2, the shear waves and the slow compressional waves become important in acoustic propagation. For hard porous rocks, such as sandstones and corals, the attenuation of acoustic waves by a porous rock increases with frequency. For a given soft sediment, the acoustic attenuation becomes maximum when the sediment properties are such that $k_s f/\beta\nu$ is about 0.1. Near the critical value $k_s f/\beta\nu=0.1$ the energy loss is totally due to the fast compressional waves and the fluid model may be used. However, as $k_s f/\beta\nu$ deviates from 0.1, the error associated with the fluid bottom approximation increases progressively and becomes unacceptable even for soft sediments. (25 refs.)

73812 Mesoscale variability of SOFAR group velocity in the Northwest Pacific. R.C.Schockley, S.M.Montoya (Naval Ocean Systems Center, San Diego, CA, USA).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1597-600 (May 1983).
Presents a ray-trace numerical study of the effects of mesoscale structure of the group velocity (defined as the average horizontal ray speed) of deep-refracted acoustic signals using data from a large-scale, near synoptic surface of the thermal structure in the upper 800 m of the Northwest Pacific Ocean reported by W.J. Emery, T.J. Reid, J.A. de Santo, R.N. Baer, and J.P. Dugan, (ibid., vol.66, 831-841, 1979). A representative sample of twelve sound speed profiles (SSPs) from the survey show maximum variation of 10 m/s in the group velocity of a ray with a given J value, J being the phase integral, and illustrate how particular features in the SSPs cause local maxima in the group velocity as a function of J. (6 refs.)

73813 Modeling ocean-bottom reflection loss measurements with the plane-wave reflection coefficient. N.R.Chapman (Defence Res. Establ. Pacific, FMO Victoria, British Columbia, Canada).
J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1601-7 (May 1983).
Ocean-bottom reflection loss has been measured at an abyssal plain site in the northeast Pacific Ocean. The layer of unconsolidated sediment at this site is thin (less than 200 m), and the near-surface sediments are composed of strongly reflecting sandy turbidites. In consequence, the surficial sediments and the relatively shallow substrate must be accounted for in describing the bottom loss measurements. The bottom loss has been modeled in this paper using the plane-wave reflection coefficient calculated for a geoacoustic model of the bottom developed from seismic profiling experiments carried out at the site. In the model the sediment column is described by fluid layers with a relatively small value of attenuation and a large value of sound-speed gradient in the surficial layer, and the substrate is assumed to be a solid. The bottom loss measurements are presented in 1/3 octave bands at 40, 80, and 160 Hz. The results are well-modelled at small grazing angles ($\theta\leq20°$) where the interaction is confined to the surficial sediments. At large grazing angles the importance of including a solid substrate is demonstrated. (19 refs.)

73814 Recent long-term moored instrument observations in the western North Pacific. W.J.Schmitz,Jr. (Woods Hole Oceanographic Inst., Woods Hole, MA, USA), P.P.Niiler, R.L.Bernstein, W.R.Holland.
J. Geophys. Res. (USA), vol.87, no.C12, p.9425-40 (20 Nov. 1982). [received: May 1983]
Selected results based on the first deployment (duration was 298-324 days depending on specific location) of an array of 38 current-temperature meters on 10 moorings along 152°E from 28°N to 41°N are discussed. Abyssal eddy kinetic energies along 152°E near the Kuroshio Extension are a factor of 2 to possibly 5 lower than those previously observed at similar depths close to the energetic regions of the Gulf Stream. The thermocline kinetic energy frequency distribution at 28°N, 152°E is similar in shape to that observed at a site near 31°N, 70°W (but not 28°N, 70°W), although the total energy levels are quite different. However, the distance from the corresponding strong current regimes is nearly the same. The largest scale latitudinal distribution of the off-diagonal component of horizontal Reynolds' stress has a characteristic general shape, that is, negative to the south and positive to the north of the Gulf Stream or Kuroshio Extension or mid-latitude jet. (43 refs.)

73815 Chlorofluoromethanes in the Northeast Pacific Ocean: measured vertical distributions and application as transient tracers of upper ocean mixing. R.H.Gammon (Dept. of Chem., Univ. of Washington, Seattle, WA, USA), J.Cline, D.Wisegarver.
J. Geophys. Res. (USA), vol.87, no.C12, p.9441-54 (20 Nov. 1982). [received: May 1983]
The vertical distributions of the man-made chlorofluoromethanes CCl_3F (F-11) and CCl_2F_2(F-12) have been measured at two locations in the eastern North Pacific Ocean to depths greater than 500 m. At both sites (46°N, 125°W off the Washington-Oregon coast and 50°N, 140°W in the Gulf of Alaska) the halomethane concentrations were found to fall off exponentially with increasing depth below the mixed layer. For F-11 at 50°N, the surface concentration was found to be in saturation equilibrium with the measured atmospheric concentration. The measured chlorofluoromethane profiles have been interpreted in terms of a one-dimensional model for the vertical diffusion advection of an exponentially driven, conservative tracer into a bottomless ocean. In the appropriate limit of 'transient steady state' the projected profiles are simple exponentials described by an advective-diffusive scale depth H, which is a function of the vertical eddy diffusivity K_z, the upwelling velocity w, and the characteristic time τ for the exponential growth of the tracer concentration at the boundary. (39 refs.)

73816 Gulf Stream meanders: observations on propagation and growth. D.R.Watts, W.E.Johns (Graduate School of Oceanography, Univ. of Rhode Island, Kingston, RI, USA).
J. Geophys. Res. (USA), vol.87, no.C12, p.9467-76 (20 Nov. 1982). [received: May 1983]
Presents a new method for continuously tracking the location of the Gulf Stream using a moored array of inverted echo sounders. Time series of lateral displacements of the front, shown accurate to ±8 km, have been collected along three sections spaced 100, 150, and 200 km downstream (NE) of Cape Hatteras, North Carolina, for a period of 12 months. These records are highly coherent at all periodicities longer than 4 days. From the observed phase lags, a dispersion relationship is presented for the meanders: as the period and wavelength (T, λ) increase from (4 days, 180 km) to (30 days, 600 km), the phase speed decreases smoothly from 40 to 20 km d^{-1}. The meanders exhibited rapid growth at periods longer than 4 days, doubling in variance in each 50-km step downstream. (23 refs.)

73817 Energy saturation and phase speeds measured on a natural beach. E.B.Thornton (Naval Postgraduate School, Monterey, CA, USA), R.T.Guza.
J. Geophys. Res. (USA), vol.87, no.C12, p.9499-508 (20 Nov. 1982). [received: May 1983]
Field measurements of wave height and speed from 7-m depth shoreward are described. The experiment plan consisted of a shore-normal transect of closely spaced (compared to a dominant wave length) velocity, pressure, and elevation sensors on an almost plane profile having an inshore slope of 1:50. As the waves shoal and begin to break, the dominant dissipative mechanism is due to turbulence generated at the crest, and wave heights become increasingly depth controlled as they progress across the surf zone. Wave heights in the inner surf zone are strongly depth dependent; the envelope of the wave heights is described by $H_{rms}=0.42$ h. The depth dependence of the breaking wave height is shown to be related to the kinematic instability criterion. Celerity spectra were measured by using phase spectra calculated between pairs of adjacent sensors. (34 refs.)

73818 Continental shelf waves of diurnal period along Vancouver Island. W.R.Crawford, R.E.Thomson (Inst. of Ocean Sci., Sidney, BC, Canada).
J. Geophys. Res. (USA), vol.87, no.C12, p.9516-22 (20 Nov. 1982). [received: May 1983]
Recent surveys of tides and currents on the continental shelf along the west coast of Vancouver Island have shown the diurnal tide currents to be larger than the semi-diurnal by a factor of 2-4, although the ratio $(K_1+O_1)/(M_2+S_2)$ for the tidal heights is only 0.6. The authors attribute the diurnal currents to continental shelf waves, and show that the continental shelf and slope off Vancouver Island allow first mode barotropic shelf waves at the diurnal frequency. The tidal heights and deep water currents of K_1 and O_1 frequency behave as progressive Kelvin waves with height 43 cm at shore, and currents of 1-2 cm/s. The observed shelf waves at these frequencies have amplitudes at shore of 5 and 3 cm, and currents of order 10 and 6 cm/s, respectively. The Kelvin and shelf waves are in phase near Ucluelet and out of phase near Kyuquot, as determined by both current meter and shore tide gauge observations. (18 refs.)

73819 The subtropical front: satellite observations during FRONTS 80. M.Van Woert (Scripps Inst. of Oceanography, La Jolla, CA, USA).
J. Geophys. Res. (USA), vol.87, no.C12, p.9523-36 (20 Nov. 1982). [received: May 1983]
Satellite-derived sea surface temperature, in situ hydrography data, and satellite-tracked drifter data collected during winter 1979-1980 as part of the FRONTS 80 experiment are used to describe the spatial structure of the North Pacific subtropical front northeast of Hawaii. The satellite observations reveal a deformation scale meander (85 km×32 km) in association with the front having an evolution time scale of ~60 days. The satellite measurements of the change in sea surface temperature across the front are typically 1°C within a distance of 10 km. The correlation coefficients between the satellite data and the in situ hydrographic data were computed and found to be significantly nonzero above 800 m. The high correlation at deep levels indicates that the satellite was viewing a feature with sizeable vertical extent, not just a surface phenomenon. (30 refs.)

73820 Oceanographic aspects of the Emperor Seamounts region. G.I.Roden (School of Oceanography, Univ. of Washington, Seattle, WA, USA), B.A.Taft, C.C.Ebbesmeyer.
J. Geophys. Res. (USA), vol.87, no.C12, p.9537-52 (20 Nov. 1982). [received: May 1983]
Effects of the Emperor Seamount Chain on the thermohaline structure and baroclinic flow are investigated on the basis of historical hydrographic data. The amplitudes of dynamic height perturbations are 3 to 5 times larger west than east of the chain. The intensity of the thermal fronts is stronger west than east of the seamounts; near the crest of the southern seamounts, strong east-west thermohaline fronts and a strong northward baroclinic flow are observed. The Kuroshio Extension west of the seamount chain is a well-defined meandering current, the axis of which generally lies between 33° and 36°N. The available data indicate that the Kuroshio Extension turns northward and then flows eastward through the gaps of the seamount chain. East of the seamounts, the Kuroshio Extension widens threefold and appears to be poorly defined. (50 refs.)

73821 An analysis of the optical features of the near bottom and bottom nepheloid layers in the area of the Scotian Rise. R.W.Spinrad, J.R.V.Zaneveld (School of Oceanography, Oregon State Univ., Corvallis, OR, USA).
J. Geophys. Res. (USA), vol.87, no.C12, p.9553-61 (20 Nov. 1982). [received: May 1983]
Profiles of light transmission versus depth have been studied in the region of the Scotian Rise of the North Atlantic at the bottom depths between 4900 and 5000 m. A component model has been developed and consists of three components of transmission which can be combined to duplicate accurately any given transmission profile. Two of the components are shown to be representative of several basic phenomena: the particle concentration within a uniform flow and the separation of a benthic nepheloid layer. In the case of a uniform flow it is the relative magnitudes of settling and eddy diffusion which determine the shape of the transmission profile. Separation of the benthic nepheloid layer was inferred to be caused by an occasional cross-slope velocity component. The physical interpretation of the third component was ambiguous. Benthic storms were observed. (20 refs.)

73822 Circulation in the Hudson Shelf Valley: MESA physical oceanographic studies in New York Bight. I. D.A.Mayer, G.C.Han, D.V.Hansen (Atlantic Oceanographic & Meteorological Labs., NOAA, Miami, FL, USA).
J. Geophys. Res. (USA), vol.87, no.C12, p.9563-78 (20 Nov. 1982). [received: May 1983]
Over 900 days of current velocity data were obtained at mainly two locations in the inner and outer Hudson Shelf Valley (HSV). The large cross-axis depth gradients in the HSV, together with the strong winter cyclones and the baroclinic density distribution over the shelf, are primarily responsible for the major circulation features observed in the valley. CSTD data from 12 cruises and meteorological data from JFK International Airport and an environmental buoy were collected concurrently with the current meter data. Although the mean cross-shelf pressure gradient is generally seaward in the Middle Atlantic Bight, it is shoreward in the HSV below the level of the adjacent continental shelf (shelf horizon), thus imposing a bias towards upvalley flow. The average velocity below the surrounding shelf horizon in the HSV is upvalley or shoreward (west-northwestward ≈290° T) in the range of 2-5 cm/s. The circulation in the HSV is seasonal and individual events can drastically alter the mean picture. (28 refs.)

73823 The structure of circulation: MESA physical oceanographic studies in New York Bight. II. D.A.Mayer (Atlantic Oceanographic & Meteorological Labs., NOAA, Miami, FL, USA).
J. Geophys. Res. (USA), vol.87, no.C12, p.9579-88 (20 Nov. 1982). [received: May 1983]
For pt.I see ibid., vol.87, no.C12, p.9563-78 (1982). The structure of velocity in New York Bight (NYB) is examined for motions in the low frequency meteorological band (periods greater than 3 days) and for those in the semi-diurnal band during the years 1975, 1976, and 1978. An empirical modal analysis suggests that, in the lower part of the water column in the unstratified season, nearly 80% of the low frequency energy is in phase across the shelf and is organised along the major isobaths. These motions exhibit a remarkable coherence that is visually apparent across the shelf for distances up to 80 km. Near-surface motions are less organised presumably because of the surface wind stress field. Maximum coherence between the observed wind

stress and currents occurs with wind angles that vary from 60° T near the New Jersey coast to 80° T at mid-shelf just northeastward of the Hudson Shelf Valley which is consistent with the analysis of sea level records by Wang (1979). The analysis suggests the existence of a wind-coherent disturbance propagating southwestward on the outer shelf at about 540 km/day. (15 refs.)

73824 Variability of the near-surface residual current in the lower St. Lawrence estuary. M.I.El-Sabh, H.-J.Lie (Dept. d'Oceanographie, Univ. du Quebec, Rimouski, Quebec, Canada), V.G.Koutitonsky.
J. Geophys. Res. (USA), vol.87, no.C12, p.9589-600 (20 Nov. 1982). [received: May 1983]
Current measurements of 1- and 4- month duration from May 1979 taken at 10 stations in the lower St. Lawrence estuary were subject to time series analysis. It was found that the spectral energy density of the near-surface current in the sub-inertial frequency range is comparable to the energy concentrated in the semi-diurnal frequency band. The strong residual current decreases rapidly with depth while the tidal current is more or less uniform from surface to bottom. A cross-spectral analysis showed that the longshore current at a station near the south shore was negatively correlated to the current at a north shore station with high coherence in the period range greater than 7 days. Evidence was found for the existence of a cross-channel current at stations in the centre of the channel. The near-surface circulation system in the area was classified into three types of pattern. (22 refs.)

73825 Vertical overturns: a comparison of Thorpe and Ozmidov length scales. T.M.Dillon (School of Oceanography, Oregon State Univ., Corvallis, OR, USA).
J. Geophys. Res. (USA), vol.87, no.C12, p.9610-13 (20 Nov. 1982). [received: May 1983]
An objective measure of the length scale of turbulent overturning events, the Thorpe scale, L_T, is compared to the Ozmidov scale $L_0=(\epsilon/N^3)^{1/2}$, where N is the buoyancy frequency and ϵ is the kinetic energy dissipation rate. Far from the surface in wind-forced mixing layers and in the seasonal thermocline, L_0 and L_T are of the same order, but near the surface of a mixing layer, L_0 is significantly larger than L_T. The change in the ratio L_0/L_T is attributed to a decrease in the gradient Richardson number in the highly energetic zone near the surface. Another length scale, $L_B=(DC_x/N)^{1/2}$, where C_x is the Cox number and D is the molecular diffusivity of temperature is also discussed. (17 refs.)

73826 Spring season flow of the Tsushima Current and its separation from the Kuroshio: satellite evidence. O.K.Huh (Coastal Studies Inst., Louisiana State Univ., Baton Rouge, LA, USA).
J. Geophys. Res. (USA), vol.87, no.C12, p.9687-93 (20 Nov. 1982). [received: May 1983]
Attempts to determine where and how separation between the Kuroshio and Tsushima Current occurs have been inconclusive. Spring season satellite data acquired over a number of years reveals two conditions important to this question: (1) an already extensive zone of mixing between the Kuroshio and shelf waters occurring along the edge of the East China Sea shelf, and (2) plumes of warm water from the Kuroshio extending into the mixed water west of Kyushu. This mixed water is observed to form the Tsushima Current in the outer shelf of the northern East China Sea and Korea Strait. Warm plumes branching from the north wall of the Kuroshio are seen with particular clarity in imagery of April 23, 1981, and February 21, 1982. Details of the split suggests that branching was a transient event. (23 refs.)

73827 Radium 228 as a tracer of basin wide processes in the abyssal ocean. J.L.Sarmiento (Geophys. Fluid Dynamics Program, Princeton Univ., Princeton, NJ, USA), C.G.H.Rooth, W.S.Broecker.
J. Geophys. Res. (USA), vol.87, no.C12, p.9694-8 (20 Nov. 1982). [received: May 1983]
A simple model of isopycnal mixing in a circular basin is developed in order to examine the utility of the 5.75-year half-life tracer radium 228 for studying basin wide processes in the deep ocean. The model shows that it is possible to resolve diffusivities of $\lesssim 8\times 10^7$ cm^2 s^{-1} in a basin of ~3000-km diameter with profiles measured near the centre and edge of the basin. A least squares fit of the model to four abyssal profiles measured during GEOSECS in the North American Basin gives an isopycnal diffusivity of 6×10^7 cm^2 s^{-1}. (16 refs.)

73828 Wind-stress coefficients over sea surface from breeze to hurricane. Jin Wu (Coll. of Marine Studies, Univ. of Delaware, Newark, DE, USA).
J. Geophys. Res. (USA), vol.87, no.C12, p.9704-6 (20 Nov. 1982). [received: May 1983]
The empirical formula proposed recently relating wind-stress coefficients to wind velocity, $C_{10}=(0.8+0.065\ U_{10})\times 10^{-3}$, appears to be applicable even in hurricanes. This formula also agrees with the correlation curve proposed earlier, $C_{10}=[\kappa/\ln(1/aC_{10}F^2)]^2$, $F=U_{10}/(gZ)^{1/2}$, where $a=0.0185$ is the Charnock constant and $Z=10$ m is the anemometer height. (18 refs.)

73829 Observations of eastward currents in the tropical South Atlantic Ocean: 1978-1980. R.L.Molinari (Atlantic Oceanographic & Meteorological Labs., NOAA, Miami, FL, USA).
J. Geophys. Res. (USA), vol.87, no.C12, p.9707-14 (20 Nov. 1982). [received: May 1983]
Data from four cruises to the tropical South Atlantic Ocean are used to describe the current distribution at 25°W and 27.5°/28°W. Two distinct eastward-flowing countercurrents separated by a branch of the westward-flowing South Equatorial Current (SEC) were observed during all the cruises. The South Equatorial Undercurrent, located between 3°S and 5°S, has a subsurface velocity core, with maximum speeds of about 0.4 m/s. Geostrophic volume transports of the SEUC, from the surface to 1000 m, range from 5 to 23 Sv. Surface flow above the core of the SEUC can be to the east or west. The South Equatorial Countercurrent (SECC) is located typically between 7°S and 9°S. Although weaker than the SEUC with transports ranging from 3 to7 Sv, the SECC also has a subsurface velocity core. (11 refs.)

73830 Surface-wave diffraction by a periodic row of submerged ducts. J.W.Miles (Inst. of Geophys. & Planetary Phys., Univ. of California, San Diego, CA, USA).
J. Fluid Mech. (GB), vol.128, p.155-80 (March 1983).
The diffraction of a gravity wave of length λ that is obliquely incident upon, and the radiation from, a periodic row of vertical circular ducts of radii a and horizontal spacing b with mouths at a distance h below the free surface of a deep ocean are determined through integral-equation and variational formulations. Numerical results for the reflection coefficient, the pressure-amplification factor (the ratio of the complex amplitude of the wave-induced pressure in the depths of the duct to that of the incident wave at the level of the mouths), and the radiation impedance (the real and imaginary parts of which are measures of the radiation damping and the virtual mass or stiffness of the fluid external to the ducts) are presented as functions of a/λ with a/b and a/h as parameters for the special case of normal incidence with $\lambda>b$ (which implies that the crests of the scattered waves are parallel to the midplane of the ducts). These results, which complement those of Simon (1981) for a single duct, are of practical interest for wave-power absorption. (17 refs.)

73831 The nonlinear Fourier analysis of internal solitons in the Andaman Sea. A.R.Osborne, A.Provenzale, L.Bergamasco (Istituto di Cosmo-Geofisica, CNR, Torino, Italy).
Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.18, p.593-9 (30 April 1983).
The authors have conducted a preliminary spectral analysis of large-amplitude internal solitons in the Andaman Sea. The methods are based upon the spectra (or scattering) transform solution of the Korteweg-de Vries equation. (8 refs.)

73832 Energy-containing eddies in the Strait of Messina. M.Abbate (Istituto di Fisica, Univ. di Roma, Rome, Italy), G.A.Dalu, E.Salusti.
Nuovo Cimento C (Italy), vol.5C, ser.1, no.5, p.571-85 (Sept.-Oct. 1982). [received: May 1983]
The velocity field, measured by Vercelli (1922-23) in the Strait of Messina hourly at six depths, is analysed to determine the size and intensity of the energy-containing eddies. The analysis is performed by separating the turbulent component of the velocity field from the deterministic tidal component. The intensity of the turbulence is given by the averaged square of the aleatoric velocities. The size of the eddies is computed through correlation of the aleatoric velocities at different depths. These eddies are far beyond the inertial range predicted by the Kolmogorov theory. The eddies are due to Kelvin-Helmoltz shear instabilities between the surface and the deeper water. (11 refs.)

73833 Influence of a water temperature anomaly in the north Atlantic on the circulation, thermal regime, and moisture cycle in the northern hemisphere atmosphere. V.P.Meleshko, A.P.Sokolov (Main Geophys. Obs., USSR).
Sov. Meteorol. & Hydrol. (USA), no.2, p.38-47 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.2, p.51-62 (1982).
A model of the general atmospheric circulation is used to investigate the influence of a water temperature anomaly in the North Atlantic on the general circulation, thermal regime, and moisture cycle in the atmosphere. A positive anomaly is specified in the zone of active thermal interaction between the atmosphere and the surface in the northeastern Atlantic Ocean. The state of the Northern Hemisphere atmosphere is calculated for January conditions by integrating the equation system over a two-month period with and without consideration of the water-temperature anomaly. The authors include a detailed comparative analysis of the atmosphere's characteristics for the Northern Hemisphere and specific regions of the European continent. (32 refs.)

73834 Numerical experiments with a model of the active ocean layer. V.A.Ryabchenko (Inst. of Oceanography, Acad. of Sci., USSR).
Sov. Meteorol. & Hydrol. (USA), no.2, p.48-52 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.2, p.63-8 (1982).
The integral model of the active ocean layer is improved to include feedback between the heat flux at the water-air interface and the surface temperature of the ocean. The results of calculation of the annual temperature cycle in the mixed layer in the area of weather station N agree well with observations. Numerical-experiment results illustrating the sensitivity of the solution to variations of the model parameters are presented. It is shown that the response of the solution is much stronger for variation of the external (atmospheric) parameters and weaker for variation of internal parameters. (7 refs.)

73835 Criteria characterizing flows of liquids with stable stratification. A.N.Shabrin (Inst. of Fluid Mech., Acad. of Sci., Ukrainian SSR).
Sov. Meteorol. & Hydrol. (USA), no.2, p.53-8 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.2, p.69-76 (1982).
Conditions under which salt water penetrates a fresh-water stream and the stability conditions of the interlayer boundaries when fresh water flows into the sea are investigated. A procedure is proposed for analysis of the nature of stably stratified fluid flows. It is established that there is a sharply defined and unique relation between the stability of the boundaries of the interlayer between liquids of unequal density and the ratio of the flow and buoyancy frequencies. Experimental results that confirm this are cited. (10 refs.)

73836 Accuracy of calculation of the parameters of wind waves at sea as a function of the basic wave-forming factors. R.A.Dalin (Leningrad Hydrometeorological Inst., Leningrad, USSR).
Sov. Meteorol. & Hydrol. (USA), no.2, p.59-63 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.2, p.77-81 (1982).
The method of linearization of a function of random arguments is used to analyze the variation of the accuracy of calculation of the average heights and periods of wind waves on a deep sea as they depend on the errors in the initial values of the basic wave-forming factors—wind velocity, fetch, and action time. Accuracy characteristics are given for the main wave-forming factors and make it possible to calculate the parameters of wind waves accurately enough for practical requirements. It is shown that wind-velocity errors have the strongest influence on the accuracy of the calculations. (5 refs.)

73837 Forecasting the water salinity of the bottom horizon of the Gulf of Riga. E.N.Zakharchenko.
Sov. Meteorol. & Hydrol. (USA), no.3, p.49-55 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.3, p.65-73 (1982).
The conditions of formation of the salinity regime of waters of the Gulf of Riga are examined. Factors causing a change in water salinity in various regions of the gulf are established. Equations are calculated which permit forecasting salinity of the bottom horizons 1-15 months in advance. An example of forecasting is given. (17 refs.)

73838 Current state and prospects of numerical investigations of variations in the level of Arctic seas. N.V.Mustafin, A.Yu.Proshutinskii (Arctic & Antarctic Sci. Res. Inst., USSR).
Sov. Meteorol. & Hydrol. (USA), no.3, p.56-61 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.3, p.74-80 (1982).
Reviews numerical investigations of the variations in the level of Arctic seas. The tasks of improving models and combining numerical and field experiments are set forth. It is emphasized that the development of operational methods of forecasting the level should be based on combined numerical and physico-statistical investigations with consideration of practical experience. It is suggested to create a complex system for numerical hydrometeorological forecasts, provided the Arctic regional administrations for hydrometeorology and environmental control are supplied with modern electronic computers. 92.20 INTERDISCIPLINARY ASPECTS OF OCEANOGRAPHY

73839 Carbon monoxide in seawater (Atlantic Ocean). R.Conrad, W.Seiler, G.Bunse, H.Giehl (Max-Planck-Inst. fur Chem., Mainz, Germany).
J. Geophys. Res. (USA), vol.87, no.C11, p.8839-52 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).
In 1978-80, measurements of dissolved carbon monoxide in seawater were carried out during three ship expeditions in the northern and southern Atlantic Ocean, covering an area between 53°N and 35°S. Carbon monoxide concentrations in the water body increased toward the sea surface, there reaching saturation factors of up to 50 with respect to atmospheric CO. The daily average CO saturation increased with average chlorophyl, concentration and light intensity and decreased with wind speed. The dissolved CO showed strong diurnal variations, with maximum values in the afternoon. Diurnal variations were observed within the entire euphotic zone, indicating that CO is both produced and consumed in the seawater. Carbon monoxide production in seawater was mainly due to photooxidation of dissolved organic matter. Photobiological and microbial CO production processes were of minor importance. (34 refs.)

73840 Exchange of H_2S between air and water. J.Spedding, M.Vujcich (Chem. Dept., Univ. of Auckland, Auckland, New Zealand).
J. Geophys. Res. (USA), vol.87, no.C11, p.8853-6 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).
The overall exchange coefficient expressed on a gas phase basis, Kg, for the transfer of H_2S from water to air was measured in the laboratory by using radioactive H_2S. The exchange coefficient showed a strong dependence on solution pH that was found to be related to enhancement by ionisation of H_2S to HS^-. At low pH values, where this enhancement had no effect, the value of Kg was 2.3×10^{-2} cm s^{-1}. At seawater pH, Kg increased to 0.13 cm s^{-1} leading to the conclusion that at pH$<$5 liquid phase resistance dominates the exchange while with increasing pH gas phase resistance becomes increasingly important. (26 refs.)

92.40 HYDROLOGY AND GLACIOLOGY

73841 The identification of Eemian Interglacial and Weichselian Interstadial deposits in Finland. J.Donner (Dept. of Geology, Univ. of Helsinki, Helsinki, Finland).
Ann. Acad. Sci. Fenn. Ser. AIII (Finland), no.136, p.1-38 (1983).
On the basis of their pollen assemblages and their stratigraphical position, the till-covered organic sediments in Finnish Lapland and Pohjanmaa can be correlated with the Eemian Interglacial and the Weichselian Perapohjola Interstadial, the latter corresponding to the Jamtland Interstadial in northern Sweden and possibly to the Karukula Interglacial in Estonia. The marine influence in southern Finland and the Karelian Isthmus during the Eemian can also be traced in the redeposited Eemian sediments in Pohjanmaa. No marine sediments of the Perapohjola Interstadial have been found in situ. In southern Sweden and Norway there is a younger, Middle Weichselian interstadial, possibly an interstadial complex, during which the central parts of the Weichselian glaciation may have been ice-free as during the earlier Weichselian interstadial. The till stratigraphy in central and southeastern Fennoscandia indicates that the Weichselian had two main ice advances separated by one non-glacial interval unknown duration. (80 refs.)

73842 Evidence of pre-late Wisconsinan glaciations on Labrador Shelf—Cartwright Saddle region. H.W.Josenhans (Atlantic Geosci. Centre, Dartmouth, Nova Scotia, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.2, p.225-35 (Feb. 1983).
High-resolution Huntec and air-gun seismic reflection profiles from Cartwright Saddle indicate the presence of at least three major glacial advances, which deposited glacial till sequences up to 100 m in composite thickness on the bottom and flanks of the saddle. These tills are found in water depths up to 600 m, and their acoustic character suggests deposition from grounded ice. Grounded ice at such depths and the presence of tills extending to the shelf edge indicate major glacial episodes. An extensive lateral moraine that flanks the southern edge of the saddle suggests that an ice tongue filled the saddle. In the deepest part of the saddle, high-resolution seismic records across a core site obtained earlier by Vilks show the core penetrates the upper part of a postglacial stratified silt sequence overlying glacial till. Extrapolating the ^{14}C date obtained by Vilks from a sediment core suggests the minimum date for the underlying till is approximately 70000 years BP. Thus there is no indication of the late Wisconsinan till in the area. (11 refs.)

73843 Hudson Bay river sediments and regional glaciation. I. Iron and carbonate dispersal trains southwest of Hudson and James Bays. J.D.Adshead (Terrain Sci. Div., Geological Survey of Canada, Ottawa, Ontario, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.2, p.290-304 (Feb. 1983).
Sands deposited from rivers draining the southwesterly trending watershed of the Cape Henrietta Maria area are enriched in calcite and are characterized by higher calcite/dolomite ratios than the sands from rivers north and south of the cape. This pattern suggests that a train of drift with distinctive carbonate composition extends southwest of Cape Henrietta Maria, indicating a dominant pattern of southwesterly ice flow in this region. Iron contents are highest for sands from rivers on Cape Henrietta Maria, suggesting iron enrichment in the sand fraction of tills in the cape area, and the existence of a broad dispersal train extending southwest of the cape. The dispersal train inferred from the calcite/dolomite ratios overprints part, but not all, of the dispersal train inferred from the iron content. (53 refs.)

73844 Hudson Bay river sediments and regional glaciation. III. Implications of mineralogical studies for Wisconsinan and earlier ice-flow patterns. J.D.Adshead (Terrain Sci. Div., Geological Survey of Canada, Ottawa, Ontario, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.2, p.313-21 (Feb. 1983).
For pt.II see ibid., vol.20, no.2, p.305-12 (1983). Mineralogical studies of river sediments from the Hudson Bay and James Bay Lowlands suggest that the glacial erosion of pre-Devonian Paleozoic carbonate rocks played an important role in the production of calcite-enriched debris in the Cape Henrietta Maria watershed. Ice flowing southwesterly across Devonian basins in western Hudson Bay and the James Bay Lowlands would largely bypass the intervening cape area. Enrichment of iron in river sands of the cape watershed is attributed to Proterozoic ferruginous sources now largely submerged under the waters of eastern Hudson Bay. Distributional patterns of carbonates and iron indicate that the dominant flow of ice from eastern Hudson Bay was southwesterly toward Cape Henrietta Maria, without major flow from the area of Proterozoic bedrock into the Nelson River watershed. In the cape area, iron enrichment due to Proterozoic sources significantly overshadows possible contributions from siderite-bearing Devonian bedrock. The fluvial sediment data are consistent with a multiple dome model of glaciation with ice mass centres located east and west of Hudson Bay. However, quartz/(total carbonate) ratios indicate that, if independent ice masses existed in this configuration, the dominant position of their contact should be placed north of the Churchill-Nelson watershed boundary. Indications of K-feldspar enrichment in Churchill sands are not evident in cap localities where ice flow was southwesterly. Rivers sands are composite channel samples of a drift cover that includes several pre-Wisconsinan tills as well as Wisconsinan deposits. Well defined regional patterns of composite (fluvial) sediment composition suggest a consistency in dominant regional ice movements through time. Similarities between regional drift dispersal limits based on these composite sediments and on pebble dispersal patterns for Wisconsinan tills further indicate that dominant ice-flow patterns in central Canada were probably similar for Wisconsinan and earlier glaciations. (30 refs.)

73845 Late Quaternary glacial history of the hermitage area of southern Newfoundland. D.A.Leckie, S.B.McCann (Dept. of Geography, McMaster Univ., Hamilton, Ontario, Canada).
Can. J. Earth Sci. (Canada), vol.20, no.3, p.399-408 (March 1983).
During Late Wisconsinan glaciation, the northern part of the Hermitage area was glaciated by Newfoundland-centred ice and the southern part by a small, complex, upland ice field, broken by nunataks. During deglaciation a lobe of Newfoundland ice dammed a lake at the head of Bay d'Espoir in which a series of small glaciolacustrine deltas were deposited. Valley glaciers from the southern ice cap reached the south coast at several locations, most notably near Harbour Breton, where a large glaciomarine delta was formed during deglaciation when sea level stood 22-24 m above present HWM. Except for three occurrences of till, no deposits were found that can be attributed to glacial events older than Late Wisconsinan. (18 refs.)

73846 Theory of the development of geothermal systems charged by vertical faults. G.S.Bodvarsson, S.M.Benson, P.A.Witherspoon (Earth Sci. Div., Lawrence Berkeley Lab., Berkeley, CA, USA).
J. Geophys. Res. (USA), vol.87, no.B11, p.9317-28 (10 Nov. 1982). [received: May 1983]
A two-dimensional model of fault-charged hydrothermal systems has been developed that considers the transient development of such systems including the effects of heat losses to the confining layers. The model can be used for theoretical studies of the development of fault-charged reservoirs. It can also be used to estimate the rate of recharge from the fault source and the time of evolution, using temperature data from wells. The model has been applied to the hydrothermal system at Susanville, California. A reasonable match with the areal temperature distribution in the primary aquifer and the temperature profiles of individual wells was obtained. This allowed an estimate of the recharge rate from the fault into the hydrothermal system to be obtained, a threefold increase in the capacity of this system was indicated. (14 refs.)

73847 On fluid reserves and the production of superheated steam from fractured, vapor-dominated geothermal reservoirs. K.Pruess, T.N.Narasimhan (Earth Sci. Div., Lawrence Berkeley Lab., Berkeley, CA, USA).
J. Geophys. Res. (USA), vol.87, no.B11, p.9329-39 (10 Nov. 1982). [received: May 1983]
Vapor-dominated geothermal reservoirs produce saturated or superheated steam, and vertical pressure gradients are close to vapor static. These observations have been generally accepted as providing conclusive evidence that the liquid saturate must be rather small ($<$50%) in order that liquid may be nearly immobile. This conclusion ignores the crucial role of conductive heat transfer mechanisms in fractured reservoirs for vaporizing liquid flowing under two-phase conditions. The authors developed a multiple interacting continuum method (MINC) for numerically simulating two-phase flow of a

homogeneous fluid in a fractured porous medium. Application of this method to reservoir conditions representative of The Geysers, California, and results from an analytical approximation show that, for matrix permeability less than a critical value (≈2.5 to 5 microdarcies), the mass flux of water from the matrix to the fractures will be continuously vaporized by heat transported due to conduction. This gives rise to production of superheated steam even when the matrix has nearly full liquid saturation. (29 refs.)

73848 A time-dependent ice sheet model: preliminary results. R.A.Bindschadler (Goddard Lab. for Atmospheric Sci., NASA Goddard Space Flight Centre, Greenbelt, MD, USA), R.Gore.
J. Geophys. Res. (USA), vol.87, no.C12, p.9675-85 (20 Nov. 1982). [received: May 1983]
A numerical model of ice sheet flow is developed. This model includes vertical resolution of temperature, stress, and strain rate. The model follows the flow of ice along a flow line within an ice sheet drainage basin. Longitudinal stresses and basal sliding are included. Basal sliding is dependent on the base shear stress and a specified distribution of basal water pressure. The numerical methods used to solve the coupled set of stress and velocity equations for the static and time-evolutionary cases are discussed. A steady state profile simulating an ice stream is calculated for a particular set of input parameters, and changes in the profile are examined for different choices of parameters. Preliminary studies of response behaviour are completed using a simplified ice sheet geometry with a fixed terminus or grounding line. Results of these studies illustrate ice sheet thinning in response to a lowered sea level or to a reduction in the extent of ice rises (or pinning points) within ice shelves. (34 refs.)

73849 Sidescan sonar recognition of subaqueous landforms in Loch Earn, Scotland. J.McManus, R.W.Duck (Dept. of Geology, Univ. of Dundee, Dundee, Scotland).
Nature (GB), vol.303, no.5913, p.161-2 (12 May 1983).
Cores obtained during sedimentological studies of British lakes reveal the presence of disturbed layering in slope face and slope foot areas, but undisturbed materials on areas of flat floor. Smith and others have suggested that these features may be due to slumping of the unconsolidated deposits. The abundance of slumping indicated by cores in many lake basins suggested that slope failure and land slipping are very widespread. The authors report that sidescan sonar surveys of the slopes of Loch Earn, Scotland, show the presence of over 100 examples of subaqueous slumps which appear to fall into three morphological types. Pinger surveys confirm sediment thickness variations, supporting suggestions of sliding in such areas. (9 refs.)

73850 Spring snow melting and evaporation of snow in central Yakutia. A.L.Are, M.S.Petropavlovskaya (Inst. of Geocryology, Acad. of Sci., USSR).
Sov. Meteorol. & Hydrol. (USA), no.2, p.72-6 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.2, p.91-6 (1982).
Discusses field observations of snow melting in 1978-1980 and evaporation from the snow in 1969-1980 at a permanent heat-balance station of the Institute of Geocryology of the USSR Academy of Sciences Siberian Division (in the vicinity of Yakutsk). Daily values are given for the snow-melting and evaporation rates, as well as melting coefficients and empirical relationships for the snow-melting rate as a function of air temperature and melting type. (5 refs.)

73851 Description of river runoff at several sites by the multivariate canonical expansion method. I.V.Busalaev, S.K.Davletgaliev (Kazakh State Univ., Kazakh SSR).
Sov. Meteorol. & Hydrol. (USA), no.3, p.62-7 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.3, p.81-7 (1982).
A method of modeling the discharge hydrograph based on multivariate canonical expansion of vector random functions is examined. It permits one to obtain realizations of the monthly values of runoff simultaneously at several discharge sites with consideration of auto- and cross-correlation functions. A check of the proposed method, for the example of the inflows of water to the Bukhtarma and Shul'ba reservoirs, shows a satisfactory accuracy for the model. (10 refs.)

92.60 METEOROLOGY

(see also 43.28 Aeroacoustics and atmospheric sound)

73852 Data on total and spectral solar irradiance. A.T.Mecherikunnel, J.A.Gatlin, J.C.Richmond (NASA Goddard Space Flight Center, Greenbelt, MD, USA).
Appl. Opt. (USA), vol.22, no.9, p.1354-9 (1 May 1983).
This paper presents a brief survey on the data available on solar constant and extraterrestrial solar spectral irradiance. The spectral distribution of solar radiation at ground surface, computed from extraterrestrial solar spectral irradiance for several air mass values and for four levels of atmospheric pollution is also presented. The total irradiance at ground level is obtained by integration of the area under the spectral irradiance curves. It is significant that, as air mass increases or as turbidity increases, the amount of energy in the infrared relative to the total increases and that the energy in the UV and visible decreases. (44 refs.)

73853 Periodicity of variations in the annual precipitation totals in Poland. K.Kozuchowski (Dept. of Meteorology, Climatology & Hydrology, Lodz Univ., Lodz, Poland).
Acta Geophys. Pol. (Poland), vol.30, no.3, p.287-92 (1982).
Discusses investigations based on the annual precipitation totals in Poland for the period 1931-80, obtained from 38 meteorological stations. Fuhrich's autocorrelation method is used and the period of oscillations of the chronological series is determined. It is found that in most of the country precipitation displays a 2-3 year period of oscillation. This result is similar to that of Suryjak (1974) who found a quasi-two-year periodicity for precipitation variations in northern and central Poland, as well as the relationship between precipitation and the date of the spring reversal of winds in the stratosphere. (6 refs.)

73854 Sodar and tower studies of the atmospheric structures near the sea coast. S.K.Aggarwal, S.P.Singal (Nat. Phys. Lab., New Delhi, India), R.K.Kapoor, B.B.Adiga.
J. Acoust. Soc. India, vol.9, no.2, p.28-38 (April 1981). [received: March 1983]
Simultaneous observations made by acoustic sounder and a meteorological tower during the month of May 1978 of the lower atmosphere at the Atomic Power Station Tarapur are reported. The probing range of the acoustic sounder was 700 metres. The meteorological tower could sense wind and temperature parameters at various levels up to a range of 120 metres. The site being close to the sea shore, the thermal atmosphere of the lower atmosphere is controlled mostly by land and sea breeze circulation. Thermal convective structure is seen during the day time and also during the night time. The frequency of plume formation and the height of the plumes is, however, low during the night time. The convective boundary layer during day time ranges from 400 m-500 m while during the night time it is mostly under 200 m. The observation of thermals during the night is explained due to the presence of a neutrally stable marine layer above 30 m height at this site. (11 refs.)

73855 Experimental study of the boundary layer over moderate relief near a mountain chain. III. Turbulent structure of the convective boundary layer at low levels analysed by Doppler sodar. G.Dubosclard (Obs. de Phys., Globe du Puy de Dome, Clermont Ferrand, France), B.Benech, J.Noilhan, A.Druilhet.
Boundary-Layer Meteorol. (Netherlands), vol.25, no.2, p.107-19 (Feb. 1983). In French.
For pt.II see ibid., vol.25, no.1, p.3-16 (1983). Doppler sodar derived values of the temperature structure parameter ${C_T}^2$, the vertical velocity variance w'^2, and the rate of dissipation of turbulent energy ϵ, were measured during unstable conditions above the Lannemezan heterogeneous site. The vertical profiles of these turbulent parameters, normalized by the classical convective scales are compared with those obtained using the same acoustic sounder above an homogeneous site during convective conditions. The typical decrease of ${C_T}^2$ as $Z^{-4/3}$ is partially verified on the heterogeneous site: for the lower levels, ${C_T}^2$ exhibits an increase with Z whereas for the intermediate levels ${C_T}^2$ decreases as $Z^{-4/3}$. For the upper levels, ${C_T}^2$ increases with Z due to a signal-to-noise ratio lower than 1. The vertical profiles of w'^2 above the two sites are rather similar. However, near the base of the convective inversion Z_i, the values measured on the heterogeneous site are more scattered. (21 refs.)

73856 Modelling the height, temperature and relative humidity of a well-mixed planetary boundary layer over a water surface. H.Okland (Inst. for Geophys., Univ. of Oslo, Oslo, Norway).
Boundary-Layer Meteorol. (Netherlands), vol.25, no.2, p.121-41 (Feb. 1983).
A vertically integrated model of a developing boundary layer over a wet surface is presented, and the expected change in the relative humidity is discussed. For the case of cold air moving over a water surface of constant temperature, analytical solutions of the model equations are obtained, giving the height, temperature and relative humidity of the boundary layer as functions of the distance travelled by the air column. The relation to the problem of sea smoke is discussed. (13 refs.)

73857 Convective plumes in the atmospheric boundary layer as observed with an acoustic Doppler sodar. O.Taconet, A.Weill (CNET, CRPE, Issy-Les-Moulineaux, France).
Boundary-Layer Meteorol. (Netherlands), vol.25, no.2, p.143-58 (Feb. 1983).
The vertical velocity field and the convective plumes in the atmospheric boundary layer have been observed during morning hours with the acoustic Doppler sounder of the CRPE. A method for plume determination using acoustic soundings in the well-mixed layer is presented. Using Telford's 1970 and Manton's 1975 models, a comparison is made between the predictions of the models and the plume properties as observed by the Doppler sodar. The mean plume velocity is found to be parabolic. It is shown, restricting Monin and Obukhov similarity to conditions inside plumes and using only vertical velocity within plumes, that the observed convective plumes carry nearly sixty percent of the sensible heat flux at the top of the surface layer. (22 refs.)

73858 An interpolation method of randomly distributed atmospheric data in the height-time domain. F.Trombetti, F.Tampieri (Istituto FISBAT CNR, Bologna, Italy).
Boundary-Layer Meteorol. (Netherlands), vol.25, no.2, p.159-70 (Feb. 1983).
A numerical method for objective interpolation of boundary-layer data in the height-time domain is presented. The method is based on a diffusive transport hypothesis and allows for the determination of the optimal ratio between the height and time scales to be used for non-dimensionalising the independent variables z and t. This ratio, with dimensions of a velocity, may be related to the vertical transfer properties of the atmosphere. A few cases during springtime with different stability conditions are discussed, showing that this ratio varies by at least one order of magnitude between day and night. (12 refs.)

73859 Modulation of heat flux by different scales of advection in an urban environment. J.K.S.Ching, J.F.Clarke, J.M.Godowitch (Environmental Sci. Res. Lab., Environmental Protection Agency, Research Triangle Park, NC, USA).

Boundary-Layer Meteorol. (Netherlands), vol.25, no.2, p.171-91 (Feb. 1983).

Sensible heat flux data obtained from the US Environmental Protection Agency's Regional Air Pollution Study in St. Louis, Missouri are presented and discussed. Large spatial variations exist in heat flux on both a land-use scale and the urban scale. Arguments based upon empirical data and sampling theory show that estimates of heat flux representative of an upwind fetch l_x require a minimum observation height proportional to $z^{3/4}$. The influence of advection on the magnitude of the heat flux is also explored for both the urban and sub-urban or land-use scales. The data clearly indicate that advection can strongly modulate and even dominate the vertical heat flux above surfaces in areas which maintain large horizontal temperature gradients. (16 refs.)

73860 Wind profiles over complex terrain. Zhao Ming, H.A.Panofsky (Dept. of Meteorology, Pennsylvania State Univ., University Park, PA, USA), R.Ball.

Boundary-Layer Meteorol. (Netherlands), vol.25, no.3, p.221-8 (March 1983).

A large set of routine wind profiles has been analyzed at three towers, located in various types of complex terrain in New England. After allowing for effects of roughness change, uphill flow and stability, roughness lengths have been estimated. In general, the profiles and roughness lengths could be explained by differences in terrain features and stability. (15 refs.)

73861 Dissipation length in stable layers. J.F.Louis, A.Weill, D.Vidal-Madjar (CNET/CRPE/CNRS, Issy-les-Moulineaux, France).

Boundary-Layer Meteorol. (Netherlands), vol.25, no.3, p.229-43 (March 1983).

An attempt is made, for an anticyclonic stable situation in the atmospheric boundary layer during November 1978, to estimate the dissipation length. The turbulent dissipation and the turbulent kinetic energy, as measured on a 100 m high mast, exhibit large variability, due to the sporadic turbulent structure of the stable layer, and associated variability of the Richardson number. A comparison with different parameterizations of the turbulent dissipation rate allows a validation of these parameterizations. (30 refs.)

73862 Turbulent characteristics of a shallow convective internal boundary layer. A.-S.Smedman, U.Hogstrom (Dept. of Meteorology, Univ. of Uppsala, Uppsala, Sweden).

Boundary-Layer Meteorol. (Netherlands), vol.25, no.3, p.271-87 (March 1983).

Turbulent characteristics of a 50 to 100 m deep convective internal boundary layer are studied. The data were gathered at a flat coastal site (Nasudden on the island of Gotland, Sweden) during three consecutive days in May 1980 which were characterized by a steady, very stable stratified marine approach flow. The site is situated on a flat area ca. 1500 m from the shoreline. Only daytime runs have been analysed. The analysis shows that the turbulent regime has a mixed character. (15 refs.)

73863 A one-dimensional simulation of the stratocumulus-capped mixed layer. Chaing Chen, W.R.Cotton (Dept. of Atmospheric Sci., Colorado State Univ., Fort Collins, CO, USA).

Boundary-Layer Meteorol. (Netherlands), vol.25, no.3, p.289-321 (March 1983).

A marine stratocumulus model has been developed which has four major sub-models: (1) a one-dimensional version of the CSU cumulus model, (2) a partially-diagnostic higher-order turbulence model, (3) an atmospheric radiation model for both short-wave and long-wave radiation, and (4) a partial condensation scheme and cloud fractional parameterization. A set of numerical experiments have been performed to study the interactions among the turbulence, the long-wave radiation, the short-wave radiation, and the sub-grid condensation processes. (32 refs.)

73864 Ozone measurements from a network of remote sites. G.Evans, P.Finkelstein, B.Martin, N.Possiel (US Environmental Protection Agency, Research Triangle Park, NC, USA), M.Graves.

J. Air Pollut. Control Assoc. (USA), vol.33, no.4, p.291-6 (April 1983).

National Air Pollution Background Network O_3 data for 1979 are examined, relationships with on-site meteorological measurements are explored, and possible influences from synoptic-scale air mass movements are investigated. (6 refs.)

73865 On the correctness as a whole of boundary-value problems for models of the dynamics of the atmosphere and ocean. V.I.Sukhonosov.

Dokl. Akad. Nauk SSSR, vol.269, no.3, p.556-60 (1983). In Russian.

The global solvability of the fundamental boundary-value problems for the systems of equations for the dynamics of atmospheric processes and for the dynamics of a baroclinic ocean, assuming a uniqueness theorem holds, is established. (11 refs.) *F.Q.*

73866 Characterisation of the 50-70 GHz band for space communications. E.Damosso, L.Stola (Centro Studi e Lab. Telecommunicazioni SpA, Turin, Italy), G.Brussaard.

ESA J. (Netherlands), vol.7, no.1, p.25-43 (1983).

The propagation characteristics of the 60 GHz oxygen absorption band have been studied, using the most up-to-date information in order to obtain adequate models for the transfer characteristics of the Earth's atmosphere at these frequencies. The dependence on height and the variations with climatic conditions are investigated. The results are used to study the limitations and feasibility of the application of different types of satellite communications in the 50-70 GHz frequency band. (17 refs.)

73867 Statistical properties of the dual-polarization differential reflectivity (Z_{DR}) radar signal. V.N.Bringi (Dept. of Electrical Engng., Colorado State Univ., Ft. Collins, CO, USA), T.A.Seliga, S.M.Cherry.

IEEE Trans. Geosci. & Remote Sensing (USA), vol.GE-21, no.2, p.215-20 (April 1983).

The statistical characteristics of three estimators of the differential reflectivity (Z_{DR}) radar signal are examined theoretically and compared with pulse-to-pulse measurements of reflectivity at horizontal and vertical polarizations. The square-law and log-ratio estimators provide satisfactory means for measuring Z_{DR} while the log-ratio estimator does not. In addition, the theory is consistent with radar data, clearly showing that Z_{DR} could be measured accurately from a sequence of alternately polarized waves. (17 refs.)

73868 The composition of precipitation in remote areas of the World. J.N.Galloway (Dept. of Environmental Sci., Univ. of Virginia, Charlottesville, VA, USA), G.E.Likens, W.C.Keene, J.M.Miller.

J. Geophys. Res. (USA), vol.87, no.C11, p.8771-86 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).

The Global Precipitation Chemistry Project collects precipitation by event to determine composition and processes controlling it in five remote areas. Compositions (excluding seasalt) at St. Georges, Bermuda, were primarily controlled by anthropogenic processes; compositions and acidities at San Carlos, Venezuela, Katherine, Australia, Poker Flat, Alaska, and Amsterdam Island were controlled by unknown mixtures of natural or anthropogenic processes. Precipitation was acidic; average volume-weighted pH values are presented. Acidities at Bermuda and Alaska were from long-range transport to sulfate aerosol; at Venezuela, Australia, and Amsterdam Island, from mixtures of weak organic and strong mineral acids, primarily H_2SO_4. Relative proportions of weak to strong acids were largest at Venezuela and lowest at Amsterdam Island. Once contributions from human activities were removed, the lower limit of natural contributions was probably $\geq$pH 5. (49 refs.)

73869 The flux of dimethylsulfide from the oceans to the atmosphere. W.R.Barnard, M.O.Andreae, W.E.Watkins (Dept. of Oceanography, Florida State Univ., Tallahassee, FL, USA), H.Bingemer, H.-W.Georgii.

J. Geophys. Res. (USA), vol.87, no.C11, p.8787-93 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).

The role of biogenic dimethylsulfide from the ocean surface as a source of atmospheric sulfur is studied. On a cruise of the R/V Meteor across the Atlantic from Hamburg to Montevideo, Uruguay, the authors sampled the surface ocean at short intervals and analyzed over 300 seawater samples aboard ship. Simultaneously, the atmospheric concentration of DMS has been measured. Biological and chemical oceanographic data have been collected during the cruise to aid in the interpretation of the findings on DMS. The highest concentrations of DMS were found in productive regions on the continental shelves, in marginal seas and in some estuaries. The concentrations of DMS in the atmosphere ranged from 2 to 44 ng S(DMS)/m^3. The mean concentration is significantly lower than postulated concentrations of 40-200 ng S(DMS)/m^3 for marine background atmosphere, thus questioning the rates and mechanisms given for reactions of DMS in this environment. (27 refs.)

73870 Exchange of sulfur between the free troposphere, marine boundary layer, and the sea surface. M.A.Kritz (Space Sci. Div., NASA Ames Res. Center, Moffett Field, CA, USA).

J. Geophys. Res. (USA), vol.87, no.C11, p.8795-803 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).

A steady state analysis has been made of the sources and sinks of sulphur in the remote marine atmosphere and of the steady state exchanges of SO_2 and (excess) sulfate between the sea, boundary layer, and free troposphere. Two situations were examined: an area of high biological productivity (Gulf of Guinea) and an area of low productivity (tropical Atlantic). The results of the analysis suggest that about one-third of the 'background' concentrations of SO_2 and excess sulfate observed in the remote marine atmosphere mixes in from the free troposphere, with the balance, $\sim$100 μg S m^{-2} d^{-1}, attributed to the local oxidation of reduced sulfur-bearing precursors in the boundary layer. (60 refs.)

73871 Chemical analysis of cloud water collected over Hawaii. F.Parungo, C.Nagamoto, I.Nolt, M.Dias, E.Nickerson (NOAA, Boulder, CO, USA).

J. Geophys. Res. (USA), vol.87, no.C11, p.8805-10 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).

Two types of cloud water collectors were developed, and the devices were used to collect samples around the Hawaii Islands. The chemical analyses of cloud water showed that Na^+, Cl^-, and SO_4^{2-} ion concentrations were approximately 10^{-4} m; NH_4^+, NO_3^-, and Ca^{++} were 1 order of magnitude lower. The pH values were in the range of 4-5 regardless of sampling locations. The high acidity of cloud water over Hawaii may originate in the ocean or from long-range transport of anthropogenic pollution, in addition to local pollution, if present. (13 refs.)

73872 Clouds and wet removal as causes of variability in the trace-gas composition of the marine troposphere. A.M.Thompson, R.J.Cicerone (Scripps Inst. of Oceanography, Univ. of California, San Diego, CA, USA).

J. Geophys. Res. (USA), vol.87, no.C11, p.8811-26 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).

Describes a modeling study of the effects of clouds and wet removal on the chemistry of the remote marine troposphere. Using a time-dependent model with parameterized vertical transport to calculate trace-gas concentrations, it was that large variations in key species (e.g. HNO_3, H_2CO, and H_2O_2) result from simulations of sporadic rainfall, changes in cloud cover, and external inputs such as surface NO sources. Depending on the frequency and intensity of an event, the effects of these perturbations may persist for several days. Long-term integrations with fixed boundary conditions and regularly occurring cloud and rain episodes demonstrate a strong sensitivity of the mean concentration of longer-lived soluble gases to precipitation frequency but also confirm the validity of using properly chosen parameterizations of wet removal in steady state calculations. (58 refs.)

73873 Air-sea exchange of CO_2 and evidence for enhanced upward fluxes. M.L.Wesely, D.R.Cook, R.L.Hart, R.M.Williams (Radiological & Environmental Res. Div., Argonne Nat. Lab., Argonne, IL, USA).

J. Geophys. Res. (USA), vol.87, no.C11, p.8827-32 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).

The flux of carbon dioxide has been measured by eddy correlation techniques over shallow coastal waters at an outer submerged reef near Miami, Florida, during two weeks in March when the seawater was gradually warming. Large upward fluxes were detected, much larger than expected, and they were nearly linearly proportional to friction velocity u_* for the wind speeds of 3-10 m s^{-1} encountered. In 10 m s^{-1} winds, the flux was 0.30-0.35 mg m^{-2} s^{-1} and the aqueous transfer velocity across the interfacial sublayer was about 0.20 cm s^{-1}. The measured eddy fluxes of submicron particles were also directed upward and displayed a strong, nearly linear dependence on u_* similar to the case for CO_2. Bubbles could be a source of increased CO_2 transport. (22 refs.)

73874 Measurements of ozone vertical flux to ocean and forest. D.H.Lenschow (Nat. Center for Atmospheric Res., Boulder, CO, USA), R.Pearson,Jr., B.B.Stankov.

J. Geophys. Res. (USA), vol.87, no.C11, p.8833-7 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).

Ozone flux has been measured from aircraft by the eddy correlation technique over the Gulf of Mexico, the north Pacific Ocean, and a Gulf Coast pine forest. Measurements over the Gulf were obtained in polluted air (which had flowed down the Mississippi valley) over relatively warm water, while the north Pacific observations were obtained in pristine air over relatively cold water with nearly neutral stratification. Values of the surface resistance to ozone were about 1.8×10^3 s m^{-1} over both ocean surfaces and 50 s m^{-1} over the forest, with an accuracy of better than $\pm$15%. Photochemical production of ozone during midmorning with clear skies over the Gulf of Mexico was 0.2-0.3 ng m^{-3} s^{-1}. (20 refs.)

73875 **Magnitudes and sources of precipitation and dry deposition fluxes of industrial and natural leads to the North Pacific at Enewetak.** D.M.Settle, C.C.Patterson (Div. of Geological & Planetary Sci., California Inst. of Technol., Pasadena, CA, USA).

J. Geophys. Res. (USA), vol.87, no.C11, p.8857-69 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).

A total atmospheric Pb input flux of 7 ng Pb cm^{-2} yr^{-1} was measured in the North Pacific Easterlies at Enewetak. Parameters used to measure this flux were ratio of dry deposition flux to precipitation flux; Pb/^{210}Pb in precipitation and seawater; ^{210}Pb flux; washout factor; and Pb concentrations in air, rain, and dry deposition deposits. Relations among these parameters established at Enewetak were used to recompute and confirm previous estimates of lead fluxes to the oceans (ng Pb cm^{-2} yr^{-1}) at the following locations: North Atlantic Westerlies, 170; North Pacific Westerlies, 50; and South Pacific Easterlies, 3. Prehistoric lead output fluxes to sediments at these locations are described. The relative importance of natural pollution sources is deduced. Seasonal depositional variations were studied. (52 refs.)

73876 **Sporadic transport and deposition of continental aerosols to the Pacific Ocean.** S.Tsunogai, T.Kondo (Dept. of Chem., Hokkaido Univ., Hakodate, Japan).

J. Geophys. Res. (USA), vol.87, no.C11, p.8870-4 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).

Aerosol samples were collected in the surface air over the North Pacific onboard a vessel in May and June 1980 and were analyzed for Na, Al, Fe, Mn, and ^{210}Pb. The concentration ratios of Fe/Al and Mn/Al are similar to those of crustal material. The concentration of Al in the maritime surface air was usually observed to be 30-50 ng/m^3. On June 9, however, an extremely high concentration of 670 ng/m^3 of Al was observed at 30°N, 161°E. The Al concentration is still insufficient to explain the accumulation rate of aluminosilicate in the pelagic sediment if the deposition velocity is 1 cm/s, but the nature of the 'Kosa' particles is possible to explain it, even though the dust particles are sporadically transported. (16 refs.)

73877 **Marine aerosol chemistry at Cape Grim, Tasmania, and Townsville, Queensland.** M.O.Andreae (Dept. of Oceanography, Florida State Univ., Tallahassee, FL, USA).

J. Geophys. Res. (USA), vol.87, no.C11, p.8875-85 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).

During September 1979, aerosol samples were collected at two coastal sites, Cape Grim, Tasmania, in the southern temperate latitudes, and Townsville, Queensland, in the subtropical region. The samples were analyzed for the light elements ($6 \leq Z \leq 19$) by proton elastic scattering analysis (PESA) and for the heavier elements ($Z \geq 12$) by PIXE. As anthropogenic and continental influences are essentially nonexistent along the track of air-masses for several days before they reach Cape Grim, this site is ideally suited for the study of purely marine air-masses. Sulfur at this site is dominated by seasalt, and the submicron sulfur particle mode universally encountered in the southern tropics and the northern hemisphere is almost not detectable here. Other element concentrations that were studied include Ca, Cl, C (both organic and as soot), N and K. (37 refs.)

73878 **Airborne ice nucleus measurements around the Hawaiian Islands.** R.C.Schnell (Cooperative Inst. for Res. in Environmental Sci., Univ. of Colorado, Boulder, CO, USA).

J. Geophys. Res. (USA), vol.87, no.C11, p.8886-90 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).

Atmospheric ice nucleus and aerosol samples were collected with an aircraft at various altitudes over the ocean upwind of the Hawaiian Islands on four days in June 1980. Below the subtropical trade wind inversion, ice nucleus activity was detectable at −10°C in concentrations of $1l^{-1}$ active at −12°C. Above the inversion, threshold activity decreased to −15°C and colder. Ice nucleus concentrations were about 10^{-5} of the number of aerosol particles at all levels. (25 refs.)

73879 **Nonsteady state simulations of the global mercury cycle.** G.E.Millward (Dept. of Marine Sci., Plymouth Polytech., Plymouth, England).

J. Geophys. Res. (USA), vol.87, no.C11, p.8891-7 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).

A time-dependent global cycling model consisting of five reservoirs has been developed to examine the effects of the anthropogenic mobilization of mercury. An unpolluted steady state was perturbed by allowing the mercury efflux from the land to the atmosphere to increase with time, in line with trends implied from mercury in Greenland ice cores and present day fluxes. The results showed that with a variety of initial conditions the atmospheric content increased by a factor of about 6 with a maximum concentration occurring some 700 years after the perturbation. The ocean surface increased by about 50% over the same time scale and both these biologically important reservoirs relaxed to new steady states in about 4000 years. The sensitivity of the model to changes in some of the important rates was investigated. (28 refs.)

73880 **Whitecap aerosol productivity deduced from simulation tank measurements.** E.C.Monahan, K.L.Davidson (Dept. of Meteorology, Naval Postgraduate School, Monterey, CA, USA), D.E.Spiel.

J. Geophys. Res. (USA), vol.87, no.C11, p.8898-904 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).

An estimate of dF_0/dr; the sea spray aerosol production per increment droplet radius per unit time per unit area of the ocean, has recently been obtained from a term-by-term evaluation of the following expression: $dF_0/dr = dE/dr\tau^{-1}W(U)$. The differential whitecap aerosol productivity, dE/rr, the number of aerosol droplets per increment droplet radius produced during the decay of a unit area of whitecap, has been redetermined, for the size range 0.8 $\mu m < r < 8$ μm, from the results of recent experiments in the University College, Galway, whitecap simulation tank in which Particle Measuring Systems aerosol spectrometers were used. The characteristic decay time for whitecaps, τ, and the initial whitecap area were in the present study determined from the frame-by-frame analysis of cine-film recordings of whitecaps generated in the simulation tank. (26 refs.)

73881 **Sea spray: a further look.** Jin Wu (Coll. of Marine Studies, Univ. of Delaware, Newark, DE, USA).

J. Geophys. Res. (USA), vol.87, no.C11, p.8905-12 (20 Oct. 1982). [received: May 1983] (Symposium on the Role of the Oceans in Atmospheric Chemistry (ROAC), Hamburg, Germany, 24-27 Aug. 1982).

Earlier laboratory and oceanic results on parametric descriptions of concentrations and sizes of spray droplets are critically compared. This summary also encompasses mechanism of spray production, conditions of spray inception, and various distributions of droplets in both laboratory tanks and the field. These results are then used, along with further analyzed calculations of droplet motion in the turbulent surface layer, to relate sea spray to other oceanographic phenomena. (32 refs.)

73882 **A model for the relationships between precipitation D/H ratios and precipitation intensity.** C.J.Yapp (Dept. of Geology, Univ. of New Mexico, Albuquerque, NM, USA).

J. Geophys. Res. (USA), vol.87, no.C12, p.9614-20 (20 Nov. 1982). [received: May 1983]

A simple quantitative model has been developed which predicts that a parametric correlation between the isotopic composition of precipitation and precipitation intensity can exist as a consequence of the condensation process when certain conditions are met. These conditions include the following: (1) approximate constancy, from one sampling interval to the next, of the initial isotopic composition of the water vapour in precipitation-producing air masses; (2) approximate constancy of the initial condensation temperature; (3) approximate constancy of the rate of vertical ascent of the precipitating air mass; and (4) approximate constancy of the ratio of condensed water to water vapour. Such conditions are probably rare in nature for the short collection intervals represented by existing samples. However, with the probable exception of condition 3, tropical oceanic islands may satisfy the preceding conditions on the month-to-month time scale for which precipitation samples have generally been collected for isotopic analysis. Precipitation samples from Wake and Johnston islands that plot on the meteoric water line were used to compare monthly δD values with corresponding precipitation intensity. The data for these two islands suggest that a simple precipitation δD versus intensity correlation is unlikely for monthly sample intervals. However, the issue remains unresolved for longer time scales. (20 refs.)

73883 **A study of atmospheric diffusion from the LANDSAT imagery.** Y.Viswanadham, J.A.Torsani (Inst. de Pesquisas Espaciais, Sao Paulo, Brazil).

J. Geophys. Res. (USA), vol.87, no.C12, p.9621-35 (20 Nov. 1982). [received: May 1983]

Detailed analyses of the LANDSAT multispectral scanner (MSS) data of the smoke plumes that originated in eastern Cabo Frio, Brazil (22°59′S; 42°02′W) and crossed over into the Atlantic ocean are presented to illustrate how high-resolution LANDSAT imagery can aid meteorologists in evaluating specific air pollution events. The eleven LANDSAT images selected are for different months and years. Conventional interpretation techniques are applied to analyse the images with a view to arriving at certain plume characteristics. The analysis of the visible smoke plumes revealed that the plume was 130 km long and attained a maximum width of 937 m, 10 km away from the chimney emitting the effluent. The results show that diffusion is governed primarily by water and air temperature differences. (59 refs.)

73884 **Winds between San Diego and San Clemente Island.** C.E.Dorman (Dept. of Geological Sci., San Diego State Univ., San Diego, CA, USA).

J. Geophys. Res. (USA), vol.87, no.C12, p.9636-46 (20 Nov. 1982). [received: May 1983]

Dense ship observations off San Diego were used to capture the diurnal and seasonal wind trends. The land breeze regime extends to 40 km off San Diego in the winter, but goes to less than 10 km when averaged for the winter. Significant diurnal variations in wind speed occur in all seasons from the coast to beyond 140 km. Ship observations were averaged over 0.2° of latitude and longitude. These have significant structure that is obscured in other studies based upon 1° averages. Wind speeds decrease by a factor of 2 or more from 140 km offshore to the coast in both the northerly and westerly component. The mean flow has a weak summer southerly component. This is in opposition to earlier studies. Ship observations were compared to San Diego Airport and San Clemente Island measurements in order to check the accuracy of allowing land measurements to substitute for over water measurements. San Diego winds were found to be very representative of the nearest 10 km of ocean in wind speed and direction on the diurnal and seasonal scales. (20 refs.)

73885 **Sensitivity of ozone retrievals in limb-viewing experiments to errors in line-width parameters.** M.A.H.Smith (NASA Langley Res. Center, Hampton, VA, USA), L.L.Gordley.

J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.5, p.413-18 (May 1983).

The variance of atmospheric ozone concentration profiles retrieved in IR limb-viewing experiments is examined over the range of published ozone half-width values. Simulated retrievals are performed for a typical satellite-based high-resolution absorption experiment and a broad-band emission experiment. The results indicate that, for limb-viewing experiments, inaccurate collision-broadened linewidth values can lead to significant errors in retrieved profiles for broad-band radiometric data or for isolated strong lines in high-resolution spectra. (17 refs.)

73886 **Effect of wind-generated waves on the transfer of solar radiation in the atmosphere-ocean system.** T.Nakajima, M.Tanaka (Upper Atmosphere Res. Lab., Tohoku Univ., Sendai, Japan).

J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.6, p.521-37 (June 1983).

Transfer of solar radiation in the combined atmosphere and ocean system is evaluated by the matrix operator method. Derivation of the reflection and transmission matrices required for applying the matrix method is discussed introducing the shadowing effect of light by the ocean waves. Spectral and total radiation fields just above and below the ocean surface, as well as the top of the atmosphere, are numerically calculated using several optical models of the atmosphere, ocean, and wind roughened ocean surface. Dependencies of radiance and flux reflectivity on the wind velocity and optical property of the ocean body are discussed in detail. (36 refs.)

73887 **N_2 broadening parameters of ozone at 9.6 μm.** J.S.Margolis (Jet Propulsion Lab., Pasadena, CA, USA).

J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.6, p.539-42 (June 1983).

The N_2 broadening parameters for approx. 150 lines of ozone (mainly ν_3 transitions) in the 9.6 μm region have been measured from spectra taken with 0.005 cm^{-1} resolution. (10 refs.)

73888 **A simple hourly clear-sky solar radiation model based on meteorological parameters.** J.E.Sherry, C.G.Justus (School of Geophys. Sci., Georgia Inst. of Technol., Atlanta, GA, USA).

Sol. Energy (USA), vol.30, no.5, p.425-31 (1983).

An hourly solar radiation model, based on observed meteorological data, was developed and tested. As a means of comparison, the Watt and Bird models and the Solmet regression models were also tested. Several conclusions were drawn about the parametrization of solar radiation-depleting parameters. It was determined that a reasonable estimate of lower layer aerosol extinction can be determined using humidity, visibility, and mixing height. The parametrization of water vapor absorption obtained by atmospheric rather than laboratory observations was found to give better model results. (13 refs.)

73889 Circumsolar radiation calculated for various atmospheric conditions. E.Thomalla, P.Kopke, H.Muller, H.Quenzel (Meteorologisches Inst., Univ. of Munich, Munchen, Germany).
Sol. Energy (USA), vol.30, no.6, p.575-87 (1983).
The circumsolar radiance and irradiance is discussed taking into account all relevant optical parameters. The decrease of the radiance from the limb of the Sun to an angular distance of 10° from the Sun's center is mainly determined by the optical depth of the atmosphere and the size distribution of scattering particles. Thin cirrus clouds have the strongest effect. In this case the radiance at 0.5° angular distance may reach about 2 per cent of the radiance of the direct Sun. In the case of aerosol scattering alone, the radiance at 0.5° does not reach more than 0.1 per cent. Therefore a field of view larger than the angular size of the Sun only gives rise to a significant increase in the total (solar plus circumsolar) irradiance if a thin cirrus layer is present. (21 refs.)

73890 Investigation of the stability of a regression scheme for forecasting the Northern Hemisphere H_{500} fields. V.A.Steblyanko, A.A.Burtsev (Hydrometeorological Sci. Res. Center, USSR).
Sov. Meteorol. & Hydrol. (USA), no.2, p.11-17 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.2, p.17-25 (1982).
A regression scheme for forecasting the Northern Hemisphere H_{500} fields is used in an experimental study of scheme stability at the stage of selection of the most informative predictors; also investigated is the dependence of forecast quality on the volume of the sample from which the regression coefficients are calculated. The informative predictors are selected by screening in combination with a moving-control procedure. An algorithm based on the stochastic approximation procedure of Robbins-Monro is proposed for investigation of the asymptotic behavior of the parameters of the regression-coefficient vector. Estimates of forecast quality are given for selection of the predictors by the screening procedure alone and by the combination of that procedure with moving control. (7 refs.)

73891 Statistics of geopotential-forecast errors. A.M.Babaliev, V.V.Kostyukov (Karaganda State Univ., Karaganda, USSR).
Sov. Meteorol. & Hydrol. (USA), no.2, p.18-23 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.2, p.26-32 (1982).
Certain statistical success properties of numerical forecasts in two operational models are presented. Problems of allowing for these properties with the object of improving the forecasts are discussed. (7 refs.)

73892 Vertical wind profile statistical control parameters. S.I.Gubanova, S.M.Olevskaya (Hydrometeorological Sci. Res. Center, USSR).
Sov. Meteorol. & Hydrol. (USA), no.2, p.24-7 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.2, p.33-7 (1982).
Problems of statistical control of vertical wind profiles are discussed. Recent data on the vertical statistical structure of the wind field are used as a basis for computing control parameters for the zonal and meridional wind components—interpolation weights and theoretical interpolation errors for three latitude belts separately for the winter and summer seasons; the results of a numerical experiment with upper-air data are presented. (8 refs.)

73893 On the spatial structure of the horizontal atmospheric moisture flux. L.P.Kuznetsova, N.P.Chernova (Inst. of Water Problems, USSR).
Sov. Meteorol. & Hydrol. (USA), no.2, p.28-32 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.2, p.38-44 (1982).
Certain statistical properties of the horizontal atmospheric moisture flux field over Western Siberia and Northern Kazakhstan are analyzed. The anisotropy of the moisture flux component fields and its relation to the atmospheric circulation are indicated. (9 refs.)

73894 Parameterization of ozone concentration fluctuations in the stratosphere. O.M.Pokrovskii, A.E.Kaigorodtsev (Main Geophys. Obs., USSR).
Sov. Meteorol. & Hydrol. (USA), no.2, p.33-7 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.2, p.45-50 (1982).
The structure of the deviations of ozone concentration from the distribution governed by the mean meridional circulation is analyzed. It is shown that these deviations are determined largely by turbulence dynamics. The structure of the deviations due to ozone transport by stationary waves is determined. It is observed that this type of transport is related to the structural features of the zonal wind in the lower stratosphere. The structure of the empirical orthogonal fluctuations is studied for both the steady and the turbulent parts of the ozone-field fluctuations. (9 refs.)

73895 Variability of atmospheric temperature and circulation regimes of the Northern Hemisphere. G.V.Gruza, L.K.Kleshchenko, T.P.Timofeeva (All Union Res. Inst. of Hydrometeorological Information, USSR).
Sov. Meteorol. & Hydrol. (USA), no.3, p.1-10 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.3, p.8-20 (1982).
Various characteristics of the atmospheric temperature and circulation regimes are obtained on the basis of mean monthly data on air temperature at sea level, surface pressure, and 500-hPa surface geopotential during 1949-1979 for the Northern Hemisphere (30-80°N). The results of an analysis of the spatial and seasonal variability of these characteristics are given. The characteristics of the structure of their long-term variation, which is described by means of a polynomial trend, are examined. (22 refs.)

73896 Effect of temperature stratification on adiabatic oscillations in a polytropic atmosphere. O.K.Gorbunova, V.M.Kadyshnikov (Hydrometeorological Res. Center, USSR).
Sov. Meteorol. & Hydrol. (USA), no.3, p.11-18 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.3, p.21-9 (1982).
The frequency spectrum of hydrothermodynamic equations linearized relative to the state of rest with a polytropic temperature distribution is investigated. An analysis of the dependence of frequencies and group velocities on the temperature lapse rate of this state and on the vertical variability of disturbances, characterized by the number of sign changes of their amplitudes, shows how with an increase of stability and decrease of variability the acoustic velocity of both types of disturbances in the atmosphere changes in this case. (4 refs.)

73897 Large temperature and precipitation anomalies in the territory of the European USSR Western Siberia, and Kazakhstan. O.V.Batyreva, L.E.Lukiyanova (Hydrometeorological Res. Center, USSR).
Sov. Meteorol. & Hydrol. (USA), no.3, p.19-26 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.3, p.30-8 (1982).
A classification of growing seasons based on the ratio of the number of large positive and negative anomalies is given. A value of 1.2 σ is taken as the criterion of a large anomaly. Four classes of growing seasons are distinguished and an attempt is made to forecast these classes by means of linear discriminant analysis. Evaluations of the verification score of the classification exceed the evaluations of a random classification. (15 refs.)

73898 Interaction of subcloud and cloud layers in tropical cyclones and Intertropical Convergence Zone. E.A.Agrenich, A.P.Khain.
Sov. Meteorol. & Hydrol. (USA), no.3, p.27-32 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.3, p.39-44 (1982).
The following are determined by means of a somewhat modified Ogura-Cho (1974) method under the assumption of a steady state: the height of the mixed layer, temperature discontinuities, and mixing ratio at the Earth's surface and at the top of the mixed layer, and mass fluxes in cumulus clouds for tropical cyclones Daisy (1961), Hilda (1964), and Inez (1966) and average tropical cyclone, and also for disturbances of the I and III GATE phases. (8 refs.)

73899 Investigation of the dynamics of the cloud cover of the tropical zone by means of two-dimensional spectral analysis. A.V.Kislov (Moscow State Univ., Moscow, USSR).
Sov. Meteorol. & Hydrol. (USA), no.3, p.33-6 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.3, p.46-9 (1982).
The space-time variability of the cloud cover of the tropical zone is studied by means of two-dimensional spectral analysis (from satellite data). An extensive region between 5°N and 20°S encircling almost the entire globe (westward from the Greenwich meridian to 40°E) is selected as the region of investigations. For the equatorial and tropical zones disturbances of the easterly wave type, the period of which is 3 days and the length in a zonal direction is about 3000 km, proved to be characteristic. (11 refs.)

73900 Models of univariate and joint distributions of nonnegative random variables. A.S.Marchenko, A.G.Semochkin.
Sov. Meteorol. & Hydrol. (USA), no.3, p.37-42 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.3, p.50-6 (1982).
It is shown that a mixture of two gamma distribution permits approximating a wide class of distributions on the positive axis occurring in hydrometeorological practice. A method of estimating five parameters of the mixture on the basis of observation data is proposed. Models of time series with marginal distribution of this type are also examined. (7 refs.)

73901 Kinetic energy dissipation in a cyclone over the ocean. K.A.Rogachev.
Sov. Meteorol. & Hydrol. (USA), no.3, p.43-8 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.3, p.57-64 (1982).
Dissipation of the kinetic energy of wind in the marine surface boundary layer of a developing cyclone over the ocean as a function of the degree of development of wind waves is investigated on the basis of a model of the interaction of wind with waves. It is shown that the density of wind kinetic energy can increase severalfold during the day just due to a change in kinetic energy dissipation in the marine surface layer related to the generation of wind waves. (14 refs.)

73902 Use of ground generators of ice-forming aerosols in works on artificial enhancement of precipitation in mountain regions. A.G.Laktionov.
Sov. Meteorol. & Hydrol. (USA), no.3, p.68-73 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.3, p.88-93 (1982).
Calculations using a Gaussian model of diffusion of a passive admixture from generators located at a height of 1000 m are presented. The mixing conditions in the atmosphere correspond to Pasquill's weather types B, C, D. An assessment is given of the necessary output of each seeding site and distances between them to provide an effective seeding of supercooled clouds with ice nuclei, with the use of ground generators installed on a windward divide. (9 refs.)

73903 Studies of an extensive anticyclonic propagation event and of some short-term enhancements observed at VHF and UHF. R.G.Flavell.
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.14-18 part 2
The paper begins by presenting a geographical analysis of 102 long-range 144 MHz amateur contacts, all verified, along distances of between 1100 km and 2944 km, made during a 24 hour period, 5/6 September 1981. Then follow examples of techniques which may be used to provide refractive index analyses of short-term enhancements of signal associated with weather fronts, structures of narrow horizontal extent which cannot be studied in detail using conventional cross sectional methods. The examples described reveal interesting details of the form of the features concerned. (4 refs.)

73904 The use of dual-linearly polarised radar data to determine rainstorm and hydrometeor types. E.L.Hines, M.J.Leitao, P.A.Watson (Postgraduate School of Electrical & Electronic Engng., Univ. of Bradford, Bradford, England).
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.51-5 part 2
The classification of the types of weather associated with various rainfall structures is a routine aspect of meteorology, usually dependent on a high degree of observer skill. In addition, a knowledge of rain-storm type is a pre-requisite to the development of slant path attenuation prediction models based on storm physical structure. In this paper we describe the application of dual-polarisation radar data to the automatic detection of rainstorm type and to the determination of hydrometeor type. (4 refs.)

92.60S Climatology

73905 **Anomalies in temperature and rainfall during warm Arctic seasons.** J.Jager, W.W.Kellogg.
Clim. Change (Netherlands), vol.5, no.1, p.39-60 (1983).
The regional patterns of change of temperature and rainfall that might accompany a global warming due to increased carbon dioxide can be studied by experiments with theoretical models of the climate system, by reconstructing the climates of past warm epochs, and by determining the anomalies of temperature and precipitation that prevailed during years or seasons when the Arctic region was unusually warm. The authors pursue the last course, making use of the northern hemisphere meteorological data record for the period 1931-1978. Hemispheric maps of anomalies of both temperature and precipitation are presented for the 10 warmest Arctic seasons and years, and for differences between the 5 warmest and 5 coldest consecutive Arctic winters. (17 refs.)

73906 **On climatic changes due to a deliberate flooding of the Qattara depression (Egypt).** M.Segal, R.A.Pielke (Dept. of Atmospheric Sci., Colorado State Univ., Fort Collins, CO, USA), Y.Mahrer.
Clim. Change (Netherlands), vol.5, no.1, p.73-83 (1983).
A numerical mesoscale model is applied to a preliminary evaluation of the mesoscale climatic changes due to a deliberate flooding of the Qattara depression in Egypt. The simulation of a typical summer synoptic situation indicates noticeable effects on the horizontal and vertical wind fields, and on the temperature and moisture patterns. (18 refs.)

73907 **The migration of geese as an indicator of climate change in the southern Hudson Bay region between 1715 and 1851.** T.Ball (Univ. of Winnipeg, Winnipeg, Manitoba, Canada).
Clim. Change (Netherlands), vol.5, no.1, p.85-93 (1983).
Observations and records maintained by the Hudson's Bay Company at York Factory and Churchill Factory on Hudson Bay between 1714 and 1825, serve as the source of information for a study of changes in the date of arrival of geese as a phenological indicator of climatic change. Changes in the migration pattern of geese are reflected in the changing date of arrival at the same location over a long period of time. Variations in this date are determined to be a function of southerly or tailwinds in the northward spring migration. (15 refs.)

73908 **Some results of climatic generalisation of meteorological observations in the Antarctic.** E.P.Borisenkov, L.V.Dolganov (A.I. Voeikov Main Geophys. Obs., Leningrad, USSR).
J. Geophys. Res. (USA), vol.87, no.C12, p.9653-66 (20 Nov. 1982). [received: May 1983]
Some new climatic characteristics of the Antarctic are presented. Maps of atmospheric pressure, temperature, humidity, and wind regime, as well as probabilistic curves detailing the Antarctic climate, particularly in terms of extreme values, are given. (23 refs.)

73909 **Sensitivity of an annual mean diffusive energy balance model with an ice sheet.** K.P.Bowman (Geophys. Fluid Dynamics Program, Princeton Univ., Princeton, NJ, USA).
J. Geophys. Res. (USA), vol.87, no.C12, p.9667-74 (20 Nov. 1982). [received: May 1983]
The sensitivity of a diffusive energy balance model that contains a simple ice sheet is compared with that of a model with snow cover only. The effect of the elevated ice sheet surface on the radiative cooling is calculated by using a radiative transfer model. Because the temperature in the atmosphere decreases with height, the main effect of the ice sheet elevation is to reduce the outgoing infrared radiation. This reduction in the radiative cooling decreases the sensitivity of the ice sheet size to changes in the solar constant by partially counteracting the albedo feedback. For a reasonable choice of parameters, this effect can reduce the strength of the albedo feedback by a factor of 2. (23 refs.)

73910 **El Chichon and Britain's weather.** J.Gribbin.
New Sci. (GB), vol.98, no.1353, p.5-15 (14 April 1983).
The eruption last April of El Chichon on the Yucatan Peninsula of Mexico, was one of the three biggest volcanic explosions this century. It put 16 million tonnes of material into the upper atmosphere. Early in 1983, a consensus seemed to be emerging among theorists using computer models of the atmosphere that this material, now spreading across the northern hemisphere, would lead to a cooling of perhaps half a degree centigrade, with the peak effect occurring in the late summer of 1983 or the winter of 1983-4. But a detailed study of the climatic effects of major historial eruptions has now led Mick Kelly and Chris Sear, of the Climatic Research Unit in Norwich, to conclude that the peak influence of El Chichon on climate has already passed. 92.65 ATMOSPHERIC OPTICS

(see also 42.00 Optics)

73911 **Global distribution of stratospheric aerosols by satellite measurements.** M.P.McCormick (NASA, Langley Res. Center, Hampton, VA, USA).
AIAA J. (USA), vol.21, no.4, p.633-5 (April 1983).
Describes the first-ever global aerosol climatology that is being developed by two Earth-orbiting satellite sensors: stratospheric aerosol measurement II (SAM II) and stratospheric aerosol and gas experiment (SAGE). The data will show the normal background aerosol, its seasonal and hemispheric variations, the existence of polar stratospheric clouds (probably made up of ice particles), and the impact of volcanic eruptions (particularly the 1980 eruption of Mount St. Helens). (9 refs.)

73912 **Atmospheric transmission at Davos, Switzerland 1909-1979.** D.V.Hoyt, C.Frohlich (Phys.-Meteorologisches Obs., World Radiation Center, Davos, Switzerland).
Clim. Change (Netherlands), vol.5, no.1, p.61-71 (1983).
Pyrheliometric measurements at Davos, Switzerland, from 1909 to 1979 are used to reconstruct the time history of atmospheric transmission. Measurements were numerous enough to allow yearly and seasonal values of atmospheric transmission to be determined. Other than the eruptions of Katmai in 1912 and Agung in 1963, there are no significant long-term changes in atmospheric transmission observed at this central European site. The implications of this result upon those theories of climatic change which depend upon changes in atmospheric transmission are briefly considered. (22 refs.)

73913 **The effect of surface striations on the absorption of shortwave radiation.** J.J.Carroll (Dept. of Land, Air & Water Resources, Univ. of California, Davis, CA, USA).
J. Geophys. Res. (USA), vol.87, no.C12, p.9647-52 (20 Nov. 1982). [received: May 1983]
Most natural surfaces have shortwave albedos that are directly dependent on solar zenith angle. Strong dependences are well known for liquid water and have recently been reiterated for snow surfaces [Carroll and Fitch, 1981]. Many surfaces (e.g. water and dry snow) develop systematic macroscale ripple structures due to wind action (i.e. waves and sastrugi). This paper reports calculations of the effects of such structures on the solar radiation absorbed as a function of latitude, season, ripple amplitude, and ripple orientation. The ripples are represented as having triangular cross sections with the two upper faces tilted at angle B from the horizontal. (10 refs.)

73914 **Rapid transmittance integration using line blending and a straight-line fit to line shapes.** V.Oinas (M/A-Com Sigma Data Services Corp., New York, NY, USA).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.5, p.407-11 (May 1983).
A rapid integration procedure has been developed for calculating transmittances of atmospheric gases. The basis for the method is the direct calculation of equivalent widths by a parametric formulation and the representation of the line shapes by a series of straight-line segments. In addition, nearby lines are blended to give a reduced number of suitably averaged lines. The method achieves run times approximately an order of magnitude faster than conventional line-by-line integration, with accuracies of a few digits in the third decimal place for wavenumber intervals of $10\ cm^{-1}$. (4 refs.)

73915 **A radiative transfer model for surface radiation budget studies.** S.K.Gupta (NASA Langley Res. Center, Hampton, VA, USA).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.5, p.419-27 (May 1983).
A high resolution spectral radiative transfer model of the troposphere for computing downwelling radiance and flux density at the surface in the 5-200 μm region has been developed. The model is fast and accurate and takes into consideration all major and minor constituents active in this region, namely, water vapor, carbon dioxide, ozone, nitrous oxide, and methane. It uses the quasi-random band model of absorption for computing atmospheric transmittances due to various bands. Continuum absorption by water vapor in the 8-14 μm region has also been taken into account. The model has been used to examine the sensitivity of downwelling flux to variations of surface water vapor pressure (or surface relative humidity), water vapor scale-height and concentrations of other gaseous constituents of the atmosphere. In addition, sensitivity to changes in a number of cloud parameters, namely, fractional cloud cover, cloud height, and high-cloud emissivity, has also been examined. Results obtained with the present model compare well with those from other empirical and semi-empirical correlations. The present work demonstrates, for the first time, the feasibility of using a high-resolution narrow-band model for computing this flux for a meteorological application. (23 refs.)

92.90 OTHER TOPICS IN HYDROSPHERIC AND ATMOSPHERIC GEOPHYSICS

73916 Isotopic composition of the ocean-atmospheric system in the geologic past. J.Hoefs (Geochem. Inst., Gottingen, Germany).
In book: *Evolution of the Earth*, R.J.O'Connell, W.S.Fyfe [Ed.], p.110-19. Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
Besides the oxygen stable isotopic composition of ocean water this review concentrates on the sulfur isotopic composition of ocean sulfate, the carbon isotope composition in the system ocean-atmosphere-biosphere and the strontium isotopic composition of ocean water. It is shown that there are definite fluctuations in the isotopic composition of these elements during the Earth's history, especially during the Paleozoic. These changes can only be explained if very important geologic parameters have fluctuated, two of which are the distribution of land and sea, and the atmospheric oxygen concentration (maybe due to varying rates of photosynthesis or carbon burial and sulfide oxidation). (63 refs.)

93.65 DATA ACQUISITION AND STORAGE

73917 Probabilistic cluster labeling of imagery data. C.B.Chittineni (Conoco Inc., Ponca City, OK, USA).
IEEE Trans. Geosci. & Remote Sensing (USA), vol.GE-21, no.2, p.145-55 (April 1983).
The author considers the problem of obtaining the probabilities of class labels for the clusters using spectra and spatial information from a given set of labeled patterns and their neighbors. A relationship is developed between class and cluster conditional densities in terms of probabilities of class labels for the clusters. Expressions are presented for updating the a posteriori probabilities of the classes of a pixel using information from its local neighborhood. Fixed-point iteration schemes are developed for obtaining the optimal probabilities of class labels for the clusters. These schemes utilize spatial information and also the probabilities of label imperfections. Furthermore, experimental results from the processing of remotely sensed multispectral scanner imagery data are presented. (21 refs.)

73918 Edge and line detection in multidimensional noisy imagery data. C.B.Chittineni (Conoco Inc., Ponca City, OK, USA).
IEEE Trans. Geosci. & Remote Sensing (USA), vol.GE-21, no.2, p.163-74 (April 1983).
Detection of edges and lines in multidimensional data is an important operation in a number of image processing applications. The multidimensional picture function is a sampling of the underlying reflectance function of the objects in the scene with the noise added to the true function values. Edges and lines refer to places in the image where there are jumps in the values of the function or its derivatives. The multidimensional greytone surface is expanded as a weighted sum of basis functions. Using multidimensional orthogonal polynomial basis functions, expressions are developed for the coefficients of the fitted quadratic and cubic surfaces. The parameters of the fitted surfaces are obtained when there is a rotation in the coordinate system. Assuming the noise is Gaussian, statistical tests are devised for the detection of significant edges and lines. Direction isotropic properties of the fitted surfaces are described. For computational efficiency, recursive relations are obtained between the parameters of the fitted surfaces of successive neighborhoods. Furthermore, experimental results are presented by applying the developed theory to multiband Landsat-Imagery Data. (11 refs.)

73919 A two step linear statistical technique using leaps and bounds procedure for retrieval of geophysical parameters from microwave radiometric data. P.C.Pandey, R.K.Kakar (Earth & Space Sci. Div., Jet Propulsion Lab., Pasadena, CA, USA).
IEEE Trans. Geosci. & Remote Sensing (USA), vol.GE-21, no.2, p.208-14 (April 1983).
A linear statistical technique using leaps and bounds procedure is developed for retrieving geophysical parameters from remote measurements. It is applied to the retrieval of sea surface temperature (SST) from the scanning multichannel microwave radiometer (SMMR) on the SEASAT satellite. The technique involves the application of an efficient algorithm to select the best fixed-size subset, of the 10 SMMR channels for linearly retrieving a given geophysical parameter. The 5 channel subset [6.6*V*, 6.6*H*, 10*H*, 18*V*, 21*H*], where *V* and *H* refer to the vertical and horizontal polarizations, respectively and numbers are the channel frequencies in gigahertz, provides the minimum RMS error in estimating SST. Comparison with ground truth indicates that the algorithm infers SST with an RMS accuracy of better than 1.5K under most environmental conditions. A quality control procedure is proposed which could further improve the accuracy. (17 refs.)

93.85 INSTRUMENTATION AND TECHNIQUES FOR GEOPHYSICAL RESEARCH

73920 Optical transmission through aerosol deposits on diffusely reflective filters: a method for measuring the absorbing component of aerosol particles. H.Rosen, T.Novakov (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Appl. Opt. (USA), vol.22, no.9, p.1265-7 (1 May 1983).
A laser transmission technique developed at Lawrence Berkeley Laboratory has been used extensively to determine the absorption coefficient and the graphic carbon content of aerosols. The laser transmission apparatus compares the transmission of a 632.8-nm He-Ne laser beam through a loaded filter relative to the transmission through a blank filter. After multiple scattering through the filter medium, the forward scattered light is collected by low *f* number optics and detected by a photomultiplier. The authors present a simple theoretical model which accounts for the observations and point out the critical role of the filter substrate as an almost perfect diffuse reflector in the technique. (12 refs.)

73921 Image intensifier gain measurements. L.S.Smith, E.P.King, L.L.Cogger (Phys. Dept., Univ. of Calgary, Calgary, Alberta, Canada).
Appl. Opt. (USA), vol.22, no.9, p.1268-70 (1 May 1983).
The application of microchannel plate (MCP) image intensifiers to measure low level monochromatic emissions such as those in aurora and airglow has created the need to evaluate these devices in appropriate terms. In particular, the current manufacturers' practices of measuring luminous gain using a tungsten light source makes it difficult to evaluate the performance of the device in measuring monochromatic radiation. The luminous gain measured in this way is typically an order of magnitude larger than the absolute power gain at visible wavelengths. The authors compare the various ways of measuring the gain of image intensifiers in order to assist potential users with applications other than visual enhancement. (2 refs.)

73922 Application of the 2-D discrete-ordinates method to multiple scattering of laser radiation. A.Zardecki, S.A.W.Gerstl, J.F.Embury (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Appl. Opt. (USA), vol.22, no.9, p.1346-53 (1 May 1983).
The discrete-ordinates finite-element radiation transport code TWOTRAN is applied to describe the multiple scattering of a laser beam from a reflecting target. For a model scenario involving a 99% relative humidity rural aerosol the authors compute the average intensity of the scattered radiation and correction factors to the Beer-Lambert law arising from multiple scattering. As the results indicate, 2-D *x-y* and *r-z* geometry modeling can reliably describe a realistic 3-D scenario. Specific results are presented for the two visual ranges of 1.52 and 0.76 km which show that, for sufficiently high aerosol concentrations (e.g. equivalent to $V=0.76$ km), the target signature in a distant detector becomes dominant by multiply scattered radiation from interactions of the laser light with the aerosol environment. The merits of the scaling group and the delta-*M* approximation for the transfer equation are also explored. (27 refs.)

73923 Video polarimetry: a new imaging technique in atmospheric science. T.Prosch, D.Hennings, E.Raschke (Inst. fur Geophysik und Meteorologie, Univ. zu Koln, Koln, Germany).
Appl. Opt. (USA), vol.22, no.9, p.1360-3 (1 May 1983).
An imaging polarimeter has been built to study the polarization of solar radiation ($\lambda=550$ nm) scattered and reflected from the natural environment. The instrument generates false color images as multiparameter display of the degree of polarization, azimuth of polarization, and the radiance. These video signals can be digitized into a computer-compatible format. As an example of application, the polarization properties of light reflected from a lake and its environment are discussed. (7 refs.)

73924 High spectral resolution lidar system with atomic blocking filters for measuring atmospheric parameters. H.Shimizu, S.A.Lee, C.Y.She (Phys. Dept., Colorado State Univ., Fort Collins, CO, USA).
Appl. Opt. (USA), vol.22, no.9, p.1373-81 (1 May 1983).
A new lidar technique for measuring the profiles of backscatter ratio, atmospheric visibility, and atmospheric temperature is proposed. Based on the theory of high resolution Rayleigh/Mie scattering, the feasibility and advan-

92.90 OTHER TOPICS IN HYDROSPHERIC AND ATMOSPHERIC GEOPHYSICS

73916 **Isotopic composition of the ocean-atmospheric system in the geologic past.** J.Hoefs (Geochem. Inst., Gottingen, Germany).
In book: *Evolution of the Earth,* R.J.O'Connell, W.S.Fyfe [Ed.], p.110-19. Washington, DC, USA: American Geophysical Union (1981), 282 pp. [0 87590 506 4]
Besides the oxygen stable isotopic composition of ocean water this review concentrates on the sulfur isotopic composition of ocean sulfate, the carbon isotope composition in the system ocean-atmosphere-biosphere and the strontium isotopic composition of ocean water. It is shown that there are definite fluctuations in the isotopic composition of these elements during the Earth's history, especially during the Paleozoic. These changes can only be explained if very important geologic parameters have fluctuated, two of which are the distribution of land and sea, and the atmospheric oxygen concentration (maybe due to varying rates of photosynthesis or carbon burial and sulfide oxidation). Specific results are presented for the two visual ranges of 1.52 and 0.76 km which show that, for sufficiently high aerosol concentrations (e.g. equivalent to V=0.76 km), the target signature in a distant detector becomes dominant by multiply scattered radiation from interactions of the laser light with the aerosol environment. The merits of the scaling group and the delta-M approximation for the transfer equation are also explored. (27 refs.)

73923 Video polarimetry: a new imaging technique in atmospheric science. T.Prosch, D.Hennings, E.Raschke (Inst. fur Geophysik und Meteorologie, Univ. zu Koln, Koln, Germany).
Appl. Opt. (USA), vol.22, no.9, p.1360-3 (1 May 1983).
An imaging polarimeter has been built to study the polarization of solar radiation (λ=550 nm) scattered and reflected from the natural environment. The instrument generates false color images as multiparameter display of the degree of polarization, azimuth of polarization, and the radiance. These video signals can be digitized into a computer-compatible format. As an example of application, the polarization properties of light reflected from a lake and its environment are discussed. (7 refs.)

73924 High spectral resolution lidar system with atomic blocking filters for measuring atmospheric parameters. H.Shimizu, S.A.Lee, C.Y.She (Phys. Dept., Colorado State Univ., Fort Collins, CO, USA).
Appl. Opt. (USA), vol.22, no.9, p.1373-81 (1 May 1983).
A new lidar technique for measuring the profiles of backscatter ratio, atmospheric visibility, and atmospheric temperature is proposed. Based on the theory of high resolution Rayleigh/Mie scattering, the feasibility and advan-

tages of using atomic vapor cells as blocking filters for measuring atmospheric parameters are demonstrated with a numerical example worked out in detail. Ten percent accuracy in determining backscatter ratio and visibility can be achieved easily. With a SNR of 300, temperature of 1K accuracy can be measured directly along with the backscatter ratio to a better accuracy of ±1%. Using a large lidar system and assuming 50-km visibility, the proposed technique can be applied to measure backscatter ratio and temperature profiles simultaneously for a 10-km path with 30-m depth resolution in 3 min. With higher SNR the atmospheric pressure profile can also be determined. (21 refs.)

73925 Random modulation CW lidar. N.Takeuchi, N.Sugimoto (Nat. Inst. for Environmental Studies, Tsukuba, Ibaraki, Japan), H.Baba, K.Sakurai.
Appl. Opt. (USA), vol.22, no.9, p.1382-6 (1 May 1983).
A new lidar scheme using a pseudorandom code modulated CW laser as a transmitting laser source (RM-CW lidar) is proposed and a demonstration of its use for aerosol measurement is shown. A formula for estimating the SNR values in RM-CW lidar was derived, and it was demonstrated that the observed SNR value was in good agreement with the calculation. (12 refs.)

73926 Seismological station of the Institute of Geophysics, Polish Academy of Sciences, in the Hornsund Fiord, Spitsbergen. M.Gorski, J.Niewiadomski (Inst. of Geophys., Polish Acad. of Sci., Warsaw, Poland).
Acta Geophys. Pol. (Poland), vol.30, no.3, p.279-85 (1982).
The seismological station operating from September 1978 in the Hornsund fiord, Spitsbergen, is briefly described. The station records natural earthquakes and glacier movements. Since seismometers are situated at four sites, the location of epicenters is possible. Instrument parameters, location of seismometer sites, and sample records are given. (5 refs.)

73927 An experiment of infrared spectroscopy for the first Spacelab mission. J.Laurent, M.-P.Lemaitre (ONERA, Chatillon, France), C.Lippens, C.Muller.
Aeronaut. & Astronaut. (France), no.98, p.60-70 (1983). In French.
An experiment, using an infrared spectrometer, has been selected by the European Space Agency as part of the First Spacelab Payload. The first flight of the Spacelab within the Space Shuttle will occur in 1983. The purpose of the experiment is to measure the atmospheric content of species between 20 and 140 km in altitude. The instrument performs limb-sounding measurements, either in emission mode or in absorption mode using the Sun as a source. This paper contains a short description of the experiment and a complete review of the scientific program scheduled for the first flight onboard Spacelab. This work is the result of a cooperation, started in 1976, between ONERA and IASB. (4 refs.)

73928 The resolution of seismic instruments used in treaty verification research. E.Herrin (Dept. of Geological Sci., Southern Methodist Univ., Dallas, TX, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S61-7 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
The resolution of the seismic sensors discussed in this paper is limited either by the self-noise of the system or the ambient ground noise at the observing site. The resolution limits of a particular system are frequency dependent. A major objective of the designer is to insure that seismic sensors are available which will be limited in resolution only by the ambient background noise at the quietest sites over the frequency band of interest in treaty verification research. This paper presents a review of the data currently available on the limiting resolution of the most advanced instruments used in this research program. (2 refs.)

73929 Automatic phase pickers: their present use and future prospects. R.Allen (Office of Earthquake Studies, US Geological Survey, Menlo Park, CA, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S225-42 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
Automatic phase-picking algorithms are designed to detect a seismic signal on a single trace and to time the arrival of the signal precisely. Because of the requirement for precise timing, a phase-picking algorithm is inherently less sensitive than one designed only to detect the presence of a signal, but still can approach the performance of a skilled analyst. A typical algorithm filters the input data and then generates a function characterizing the seismic time series. This function may be as simple as the absolute value of the series, or it may be quite complex. Event detection is accomplished by comparing the function or its short-term average (STA) with a threshold value (THR), which is commonly some multiple of a long-term average (LTA) of a characteristic function. If the STA exceeds THR, a trigger is declared. If the event passes simple criteria, it is reported. Sensitivity, expected timing error, false-trigger rate, and false-report rate are interrelated measures of performance controlled by choice of the characteristic function and several operating parameters. (17 refs.)

73930 Global digital networks—current status and future directions. E.R.Engdahl, J.Peterson, N.A.Orsini (Denver Federal Center, US Geological Survey, Denver, CO, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S243-59 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
The Global Digital Seismograph Network (GDSN), which consists of the Seismic Research Observatories, the Abbreviated Seismic Research Observatories, and the Digital World-Wide Standardized Seismograph Network stations, and the International Deployment Accelerometers (IDA) network, which is operated by the University of California, produce digital seismic data in overlapping bands from short to tidal periods. GDSN and IDA data are available through national and regional data centers, the GDSN data on network-day tapes and the IDA data on bimonthly network tapes. The usefulness of the data is being enhanced by special processing techniques that overcome some of the constraints of band-limited bandwidth, addition of horizontal short-period recording, and the recording of very long-period signals at SRO stations. Several additional stations with bore-hole seismometers are planned, possibly with satellite data telemetry to the United States. However, in the future, the most likely source of new GDSN data is through the acquisition of digital data from independently operated national and regional networks that are being installed or contemplated in several countries. (36 refs.)

73931 Digital processing of regional network data. R.B.Herrmann (St. Louis Univ., St. Louis, MO, USA).
Bull. Seismol. Soc. Am. (USA), vol.72, no.6, pt.B, p.S261-76 (Dec. 1982). (Annual Meeting of the Seismological Society of America, Anaheim, CA, USA, 19-21 April 1982).
Much more than hypocenter location can be done with digital time histories obtained from regional seismic networks. Examples are given of how these data can be routinely processed to provide readily accessible intermediate results for subsequent studies, among which are velocity inversion using teleseismic P residuals, composite focal mechanism studies, and spectral analysis. The processing must be designed to be as routine and as complete as possible. Only with these two objectives achieved can the seismic networks be as productive as they should be. (22 refs.)

73932 On the calibration and temperature behaviour of single-beam infrared hygrometers. C.J.Moore (Inst. of Hydrology, Wallingford, England).
Boundary-Layer Meteorol. (Netherlands), vol.25, no.3, p.245-69 (March 1983).
The single-beam infrared hygrometer is increasingly popular as a device capable of measuring atmospheric humidity fluctuation for use in eddy correlation studies. However, it is generally applied without recognition of the effect of temperature on its performance. Calibration data from a number of such instruments indicate that the resulting calibration coefficients vary with mean temperature as a direct consequence of temperature dependence in photodetector response. Fluctuation in atmospheric and instrumental temperatures can also introduce significant errors in the measurement of humidity fluctuations. This paper draws attention to the problem of temperature dependence in the calibration of these devices and provides a framework for investigating the magnitude of other errors involved in their use. (15 refs.)

73933 Improved procedure for Raman lidar measurements of the atmospheric temperature. V.M.Mitev, S.L.Nitsolov (Inst. of Electronics, Bulgarian Acad. of Sci., Sofia, Bulgaria).
Bulg. J. Phys. (Bulgaria), vol.10, no.1, p.86-97 (1983).
An improved procedure for lidar measurements of the atmospheric temperature by the rotational Raman scattering in the air has been considered. Several spectral regions of the lidar response are detected simultaneously. The potential accuracy of measurement of the atmospheric temperature has been analysed theoretically. The relation between the multichannel detection accuracy and the lidar parameters has been obtained. Optimum statistical estimates for the temperatures have been derived. Algorithms and programmes for computer treatment of the experimental data have been developed. A model experiment on measuring the temperature under atmospheric conditions has been carried out. Good agreement between the theoretical and the attained accuracy in lidar measurements of the atmospheric temperature has been achieved. (16 refs.)

73934 Fission track dating of kimberlitic zircons. S.E.Haggerty (Dept. of Geology, Univ. of Massachusetts, Amherst, MA, USA), E.Raber, C.W.Naeser.
Earth & Planet. Sci. Lett. (Netherlands), vol.63, no.1, p.41-50 (April 1983).
Describes fission track dating of large single-crystal zircons, 1.0-1.5 cm in dimension. The use of large crystals overcomes the limitations imposed in conventional fission track analysis which utilizes crushed fragments. Low track densities, optical track dispersion, and the random orientation of polished surfaces in the etch and irradiation cycle are effectively overcome. Fission track ages of zircons from five African kimberlites are reported. (32 refs.)

73935 A dating method with ^{39}Ar. H.H.Loosli (Phys. Inst., Univ. Bern, Bern, Switzerland).
Earth & Planet. Sci. Lett. (Netherlands), vol.63, no.1, p.51-62 (April 1983).
The principles of a dating method based on the cosmic-ray-produced radioisotope ^{39}Ar are given. Technical requirements such as background and standard gas samples and gas proportional counting systems are described. With samples extracted from Greenland ice it can be demonstrated that ^{39}Ar ages agree with ages obtained by other methods. First results on ocean water samples show that with this isotope valuable information on ocean mixing and circulation can be expected. ^{39}Ar results on groundwater samples disagree for some aquifers with conventional ^{14}C ages; possible explanations are discussed, especially underground production of ^{39}Ar. (21 refs.)

73936 Determination of the coefficients of absorption and scattering by a combined analysis of regular waves and coda. Yu.F.Kopnichev (O.Yu. Schmidt Inst. of Phys. of Earth, Acad. of Sci., USSR).
Izv. Acad. Sci. USSR. Phys. Solid Earth (USA), vol.18, no.1 (1982). Translation of: *Izv. Akad. Nauk SSSR Fiz. Zemli*, vol.18, no.1, p.34-44 (1982).
Methods of determining separately the coefficients of absorption and scattering in the lithosphere and lower mantle, are developed. The methods are based on the interpretation of regular waves and coda of the local earthquakes and on the use of multiple-scattering models. The limits of applicability of the models of single-and diffuse-scattering, are assessed. The coefficients of absorption and scattering are calculated in the lithosphere and lower mantle of the seismically active zones of Central Asia in the frequency interval of 0.6-27 Hz. (40 refs.)

73937 Drill stem resistance effects in electric telemetry links. J.Bhagwan, F.N.Trofimenkoff (Dept. of Electrical Engng., Univ. of Calgary, Calgary, Alberta, Canada).
IEEE Trans. Geosci. & Remote Sensing (USA), vol.GE-21, no.2, p.141-4 (April 1983).
An electric drill stem telemetry link with nonzero resistance is analyzed using a transmission line model. Attenuation and bandwidth are found to differ significantly from these corresponding to a perfectly conducting drill stem. The skin effect is found to reduce the channel bandwidth significantly. (5 refs.)

73938 The covariance least-squares algorithm for spectral estimation of processes of short data length. C.L.Nikias (Dept. of Electrical Engng. & Computer Sci., Univ. of Connecticut, Storrs, CT, USA), P.D.Scott.
IEEE Trans. Geosci. & Remote Sensing (USA), vol.GE-21, no.2, p.180-90 (April 1983).
A new method for generating the autoregressive (AR) process parameters for spectral estimation is introduced. The method fits AR models to the data optimally in the sense of minimizing the sum of squares of the error covariance function within the model prediction region, and is thus designated as the Covariance Least-Squares (CLS) algorithm. This minimization is shown to be identical with minimizing the weighted average one-step, linear prediction errors with adaptive weights corresponding to the energy of the data within the prediction region. The CLS algorithm is compared to the least-squares (LS) algorithm by simulation and asymptotic properties. It is shown that the CLS method combines all the desirable properties of the comparison algorithm with improved robustness in the presence of nonstationarity, namely additive transients and envelope modulation. It is also shown that the CLS algorithm provides asymptotically unbiased AR parameters, a property also shared by the comparison LS algorithm. (36 refs.)

73939 A multiple beam synthetic aperture radar design concept for geoscience applications. B.R.Jean (Dept. of Electrical Engng., Texas A&M Univ., College Station, TX, USA), J.W.Rouse,Jr..
IEEE Trans. Geosci. & Remote Sensing (USA), vol.GE-21, no.2, p.201-7 (April 1983).
The multiple beam synthetic aperture radar (SAR) has been presented as a superior alternative to conventional side-looking SAR designs for mapping

Earth resources from space. The multiple beam approach provides wide swath coverage at nearly constant incident angle while conserving peak power. These desirable system characteristics, however, are realized at the expense of additional signal processing. A design example illustrates the attributes of the multiple beam SAR in comparison to a conventional side-looking system. A novel beam formation processing architecture is shown which can provide simultaneous range compression while forming the beams. A configuration for the image formation processor is proposed and analyzed in terms of an analog implementation which can perform Doppler compression at speeds faster than real time. These implementation schemes indicate that on-board processing for the multiple beam SAR is possible. (14 refs.)

73940 An assessment of ^{40}Ar-^{39}Ar dating of incompletely degassed xenoliths. A.R.Gillespie, J.C.Huneke, G.J.Wasserburg (Div. of Geological & Planetary Sci., California Inst. of Technol., Pasadena, CA, USA).
J. Geophys. Res. (USA), vol.87, no.B11, p.9247-57 (10 Nov. 1982). [received: May 1983]
The possibility of measuring the age of eruption of Pleistocene lavas by ^{40}Ar-^{39}Ar analysis of entrapped ancient potassic xenoliths is demonstrated by a study of model systems. Upon inclusion in the hot magma such xenoliths are commonly only partially degassed of radiogenic ^{40}Ar which has accumulated in them since their original crystallization. The residual ^{40}Ar will increase the apparent K/Ar age of the xenolith. However, if a xenolith is of Cretaceous age or younger, then a plateau in its ^{40}Ar-^{39}Ar age spectrum giving the age of eruption is expected to extend over 25-50% of the total ^{39}Ar released if degassing of the xenolith in the magma exceeded 90% and if the phases in the xenolith are characterized by sufficiently different diffusion dimensions or activation energies. If diffusion was from a bimodal population of spheres, then the radii must differ by a factor of 10 or more (or the diffusion coefficients by a factor of 100 or more); or if the spheres were equal in size (and in diffusion coefficients), then the activation energies must differ by a factor of at least 1.5. That such requirements may be realized in real xenoliths containing K-feldspars is expected from published activation energies for microcline and from data determined on a granitic xenolith which was degassed in an early Pleistocene basalt flow. The experimental results appear to establish that old xenoliths may contain Ar in distinctive phases which degas at sufficiently different temperatures as to permit determination of the age of degassing or eruption. (17 refs.)

73941 The determination of the internal magnetic field in magnetic grains. G.Smith, R.T.Merrill (Dept. of Geology, Univ. of Washington, Seattle, WA, USA).
J. Geophys. Res. (USA), vol.87, no.B11, p.9419-23 (10 Nov. 1982). [received: May 1983]
For a number of years it has been supposed that for multidomain materials, the demagnetization factor *N* can be determined from either hysteresis loop or initial susceptibility measurements. Unfortunately, these methods involve a subtle circular argument which invalidates the entire analysis, ruling out the use of either of the aforementioned measurements in the determination of *N*. On examining possible alternatives to these methods the authors find the only viable one to be ferromagnetic resonance spectroscopy. Data are presented from a single crystal of magnetite which demonstrate that a reasonable value for *N* can be derived although only for the saturated state. (15 refs.)

73942 Sea surface temperature estimation using the NOAA 6 satellite Advanced Very High Resolution Radiometer. R.L.Bernstein (Scripps Inst. of Oceanography, La Jolla, CA, USA).
J. Geophys. Res. (USA), vol.87, no.C12, p.9455-65 (20 Nov. 1982). [received: May 1983]
A procedure for estimating sea surface temperature was developed by using the near and thermal infrared data available from full resolution (1.1 km field of view) daytime passes of the NOAA 6 satellite Advanced Very High Resolution Radiometer. It is demonstrated that spatially unresolved clouds and variable amounts of water vapour in the atmosphere are the major error sources. The procedure therefore incorporates a means of identifying radiometer fields of view which are virtually cloud-free, by comparing a measured solar radiation at 1μm, backscattered from the atmosphere, against that expected from a simple scattering model. (24 refs.)

73943 On the use of laser profilometry for ocean wave studies. C.R.McClain (Goddard Lab. for Atmospheric Sci., NASA/Goddard Space Flight Centre, Greenbelt, MD, USA), D.T.Chen, W.D.Hart.
J. Geophys. Res. (USA), vol.87, no.C12, p.9509-15 (20 Nov. 1982). [received: May 1983]
Airborne laser profilometer measurements of wave skewness and spectra are presented. The measurements were made during high wind and sea state conditions in the North Atlantic. The sea states ranged from 4.5 to 8.7 m and varied from swell to wind wave dominated situations. Skewness values for the five cases ranged from 0.08 to 0.28 and compare favourably with other existing measurements. Also, the Philips and Wallops spectral models show excellent agreement with profilometer spectra of developing seas. For one case where the seas were fully developed, the Pierson-Moskowitz spectrum provides the best representation. (20 refs.)

73944 A note on cross spectrum and coherence calculations. K.D.Saunders (Phys. Oceanography Branch, NSTL Station, Bay St. Louis, MS, USA), F.C.Hamrick.
J. Geophys. Res. (USA), vol.87, no.C12, p.9699-703 (20 Nov. 1982). [received: May 1983]
The physical oceanographic literature contains many instances of cross spectral and coherence calculations in which statistical stability is achieved through band averaging of the cross spectrum in frequency space, 'Constant Q' averaging is often used, sometimes with unexpected results. The present author shows how 'constant Q' frequency smoothing of the cross spectrum can lead to erroneous estimates of coherence. It is proposed that the well known technique of segment averaging using a number of raw spectral estimates computed from a sequence of time-domain windowed data be used for routine coherence (or cross-spectrum) calculations. The effects of window shape on coherence estimation are also considered. (10 refs.)

73945 July 1981 NASA workshop on passive remote sensing of the troposphere. L.S.Keafer,Jr., H.G.Reichle,Jr. (NASA Langley Res Center, Hampton, VA, USA).
J. Spacecr. & Rockets (USA), vol.20, no.2, p.172-7 (March-April 1983).
Potential roles of passive remote sensors in the study of the chemistry and related dynamics of the lower atmosphere were defined by a tropospheric passive remote sensing workshop, and technology advances required to implement these roles were identified. A promising role is in making global-scale, multilayer measurements of the more abundant trace tropospheric gaseous species (e.g., O_3, CO, CH_4, HNO_3) and of aerosol thickness and size distribution. It includes both nadir- and limb-viewing measurements. Technology advances focus on both scanning- and fixed-spectra, nadir-viewing techniques with resolutions of 0.1 cm^{-1} or better. Balloon-and Shuttle-borne experiments should be performed to study the effects of instrument noise and background fluctuations on data inversion and to determine the utility of simultaneously obtained nadir- and limb-viewing data. (19 refs.)

73946 Complementary code properties for MST radar observations. K.Wakasugi, M.Matsuo (Kyoto Inst. of Technol., Kyoto, Japan).
Mem. Fac. Ind. Arts Kyoto Tech. Univ. Sci. & Technol. (Japan), vol.31, p.31-9 (Dec. 1982). [received: May 1983]
Complementary code properties are discussed for the application to MST (mesosphere-stratosphere-troposphere) radar observations of the turbulent atmosphere. Sidelobe levels are estimated in connection with the target fluctuations and the radar system parameters. Optimized sequences of complementary codes are investigated, which maximize the sidelobe suppression and minimize the peak sidelobe when applied to MST radar observations. (10 refs.)

73947 Design of a receiving apparatus for medium frequency broadcast waves at night time. M.Mambo, T.Fukami, I.Nagano, Y.Kagawa, S.Takagi, S.Morita (Kanazawa Univ., Kanazawa, Japan).
Mem. Fac. Technol. Kanazawa Univ. (Japan), vol.15, no.2, p.121-9 (Nov. 1982). In Japanese.
Experimental studies on the short distance wave propagation at night through the ionosphere have apparently not been reported to date. In this paper, an apparatus is designed to measure the intensities of medium frequency waves in Japan at night. This apparatus has the following characteristics; (1) Each antenna is a tuned shield loop antenna, and the ratio of maximum value to minimum value of the directive pattern is nearly 50 dB. (2) To pick out only the carrier component in the desired broadcast wave interfered with by foreign broadcast waves, a receiving set with very narrow band width of 6.25 Hz has been designed by means of adding a high stable frequency signal to the terminal of the antenna. (3) The measuring equipment is set in a constant temperature oven of nearly 40°C in order to keep a constant gain for the variation of temperature. (4) The statistical calculations of fading data observed by 4 receiving sets are automatically made at a given period of time by using a microcomputer and their cumulative distributions are plotted on both Rayleigh and normal probability papers. (8 refs.)

73948 Ocean bottom tilt observation system. T.Hamatsuki, T.Hara, K.Sasaki, T.Fujisawa, I.Amikura, T.Kawasoe (Nippon Electric Co., Kawasaki, Japan).
NEC Res. & Dev. (Japan), no.68, p.67-74 (Jan. 1983).
A real time ocean bottom tilt observation system was developed under the supervision of the National Research Center for Disaster Prevention for use in earthquake prediction research. The system was installed in October 1981, on the sea bottom off the coast of Hiratsuka, Kanagawa Prefecture. This is the first system in the world, which detects a micro-tilt change in the sea bottom and transmits the data to a land station using submarine coaxial cable. (3 refs.)

73949 Analytical nonmetric close-range photogrammetry for monitoring stream channel erosion. R.Welch, T.R.Jordan (Dept. of Geography, Univ. of Georgia, Athens, GA, USA).
Photogramm. Eng. & Remote Sensing (USA), vol.49, no.3, p.367-74 (March 1983).
Vertical stereopairs are recorded before and after storms with a nonmetric 35-mm camera from a platform (H=9.5 m) constructed over a gauged stream channel. Image measurements are easily undertaken on positive film enlargements with a cartographic digitizer, and provide the input x,y image coordinates required for an analytical solution. The procedures described provide accurate results and can be used to monitor stream channel erosion. Computer graphics routines provide an efficient means of constructing DTMs, contour maps, and three-dimensional displays of changes in evaluation due to storm runoff. (12 refs.)

73950 Sonar location system for freely floating buoys. I.G.Bird (Div. of Atmospheric Phys., CSIRO, Mordialloc, Australia).
Rev. Sci. Instrum. (USA), vol.54, no.5, p.626-9 (May 1983).
A RF interrogated sonar location system for freely floating buoys is described: The location of an array of up to three buoys may be determined on an almost continuous basis with a radius of 500 m from a shipboard monitoring station. Location accuracy of typically ±0.5 m at 200-m range, low cost, and ease of operation are the major features of the system. (9 refs.)

73951 Evaluation of the spectral resolution of optical equipment for measuring minor gas components of the atmosphere. A.V.Polyakov, Yu.M., Yu.M.Timofeev (Leningrad State Univ., Leningrad, USSR).
Sov. Meteorol. & Hydrol. (USA), no.3, p.81-6 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.3, p.102-6 (1982).
Simple nomograms are proposed and described which on the basis of data on parameters of the fine structure and concentrations of minor gas components make it possible to determine the spectral resolution of satellite, balloon, and aircraft instruments. Examples of using the nomograms are given. (9 refs.)

73952 Possibility of determining the temperature profile of the atmosphere by the acoustic sounding method. A.Ya.Bogushevich, N.P.Krasnenko (Inst. of Atmospheric Optics, Acad. of Sci., USSR).
Sov. Meteorol. & Hydrol. (USA), no.3, p.87-91 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.3, p.106-10 (1982).
A method of sounding the temperature profile of the atmosphere by a bistatic acoustic radar based on the temperature dependence of the sound velocity is examined. An analysis of the main measurement error shows the possibility of determining the temperature profile to heights of 300-500 m with an acceptable accuracy. (6 refs.)

94.10 PHYSICS OF THE NEUTRAL ATMOSPHERE

(for planets, see 96.30)

73953 **Resonant extinction of lidar returns from the alkali metal layers in the upper atmosphere.** D.M.Simonich, B.R.Clemesha.
Appl. Opt. (USA), vol.22, no.9, p.1387-9 (1 May 1983).
Resonant extinction is shown to have a small but significant effect on lidar returns from upper atmospheric sodium. An equation to correct for it is developed, and the magnitude of the correction for broadband and monochromatic lasers is discussed. (12 refs.)

An experiment of infrared spectroscopy for the first Spacelab mission ......See Entry 73927

94.20 PHYSICS OF THE IONOSPHERE

(for planets, see 96.30)

73954 **On winter anomaly of short radio waves.** P.I.Velinov, V.A.Vlaskov, N.A.Smirnova (Geophys. Inst., Bulgarian Acad. of Sci., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.1, p.73-6 (1983). In French.
The absorption of short radio waves in the atmosphere takes place mainly between 75 km and 95 km in height. During the winter at temperature latitudes the degree of absorption fluctuates by a large factor, and frequently it is much greater than what is predicted by a simple theory related only to solar illumination. An extended theory is discussed which takes into account the temperature and also minor chemical constituents (water vapour, oxides of nitrogen and ozone). The extended theory is in much better agreement with typical experimental results. (14 refs.) *G.F.F.*

73955 **Quantitative study of substorm-associated VLF phase anomalies and precipitating energetic electrons.** T.Kikuchi, D.S.Evans (Radio Res. Labs., Min. of Posts & Telecommunications, Tokyo, Japan).
J. Radio Res. Lab. (Japan), vol.29, no.128, p.183-99 (Nov. 1982). [received: May 1983]
The phase anomalies associated with substorms were observed on VLF signals propagating on trans-auroral paths (transmitters at OMEGA-ALDRA (13.6 kHz), GBR (16.0 kHz) and OMEGA-NORTH DAKOTA (13.6 kHz) which were continually received at Inubo, Japan during the events on November 13, 1979. Detailed comparisons are made between these phase anomalies and geomagnetic bays, and quantitative relations are obtained with precipitating energetic electrons ($E>30$, >100 and >300 keV) detected onboard the TIROS-N and NOAA-6 satellites. It is concluded that two types of VLF phase anomalies exist which in turn are associated with two phases in the history of energetic electron precipitation into the atmosphere. The first type of phase anomaly is associated with direct injection of energetic electrons into the outer magnetosphere and atmosphere which, in turn, is completely correlated in time with development of the auroral electrojet current system. The second type arises from energetic electrons which subsequently precipitate from a trapped electron population and has a delayed onset and prolonged duration. An excellent quantitative correlation is obtained between the logarithm of the electron flux and the magnitude of the phase anomaly on the OMEGA-ALDRA signal. From the local time characteristics of this quantitative relation, it is deduced that the electrons with $E>300$ keV are the main source of D-region ionization responsible for the VLF phase anomaly. (18 refs.)

73956 **Limiting polarisations for ionospheric downgoing waves at low and medium frequencies.** M.Mambo, I.Nagano, Y.Kagawa (Kanazawa Univ., Kanazawa, Japan).
Mem. Fac. Technol. Kanazawa Univ. (Japan), vol.15, no.2, p.113-19 (Nov. 1982). In Japanese.
The limiting polarisation, which is the polarisation required by a downgoing characteristic wave to make its polarisation constant by coupling at the bottom of the ionosphere, is studied. The limiting polarisations of vertically downgoing waves in two electron density profiles, that is, a day time profile with a hollow in the D layer and a night time profile, are calculated at low and medium frequencies by a full wave method and compared with the results obtained by magnetoionic theory and the foreign experimental results. The results obtained can be summarized as follows. For the night time profile at medium frequency, the axis ratios of the limiting polarisations and the directions of the major axes of the limiting polarisations calculated by the full wave method agree with those obtained by magnetoionic theory. For day time profile at low frequency, they agree qualitatively with the foreign experimental results but are different from those obtained by magnetoionic theory. (25 refs.)

73957 **Radiation from long conducting tethers moving in the near-Earth environment.** V.Belcastro, P.Veltri (Dipartimento di Fisica, Univ. della Calabria, Calabria, Cosenza, Italy), M.Dobrowolny.
Nuovo Cimento C (Italy), vol.5C, ser.1, no.5, p.537-60 (Sept.-Oct. 1982). [received: May 1983]
Considers the problem of radiation of electromagnetic waves from a long conducting tether moving in the ionosphere. Radiation from low-frequency plasma modes, from ULF up to the electron cyclotron frequency is considered. Both the case of a passive tether (no generator) and that of a tether driven as an antenna are considered. (12 refs.)

94.30 PHYSICS OF THE MAGNETOSPHERE

(for planets, see 96.30)

73958 **Linear transformation of a slow extraordinary wave into a fast wave close to the upper hybrid resonance. Earth's radio emission in the kilometric range.** Ya.N.Istomin, O.A.Pokhotelov.
Fiz. Plazmy (USSR), vol.9, no.2, p.250-3 (March-April 1983). In Russian. English translation in: *Sov. J. Plasma Phys. (USA)*
A new mechanism is suggested for the generation of the kilometric radio emission of the Earth, based on the linear conversion of a slow extraordinary wave into a fast wave close to the upper hybrid resonance. It is shown that such a conversion is most effective in a region of reduced plasma density associated with the formation in the auroral magnetosphere of a double electric layer. The conclusions of the theory are said to be in agreement with the results of observations of the kilometric radio emission of the Earth. (10 refs.) *A.G.C.*

73959 **Alfven sweep-maser.** S.V.Polyakov, V.O.Rapoport, V.Yu.Trakhtengerts.
Fiz. Plazmy (USSR), vol.9, no.2, p.371-7 (March-April 1983). In Russian. English translation in: *Sov. J. Plasma Phys. (USA)*
A theory of the Alfven sweep maser is constructed, in which the role of active material is played by energetic protons of the radiation belts, and the resonator is a magnetic tube of force bounded at the ends by the ionospheres of conjugate hemispheres. It is shown that resonance properties of the coefficient of reflection R(w) of the Alfven waves from the ionosphere and of the relationship of R(w) to the flow of particles pouring out lead to the peaking conditions for the formation of an Alfven maser by sweeping up particles. The development of the theory enables the basic properties of a class of geomagnetic pulsations in the range Pc 1 ('pearls') to be explained. (8 refs.) *A.G.C.*

73960 **Plasmaspheric ELF hiss observed by ISIS satellites.** T.Ondoh, Y.Nakamura, S.Watanabe, K.Aikyo, T.Murakami (Radio Res. Labs., Min. of Posts & Telecommunications, Tokyo, Japan).
J. Radio Res. Lab. (Japan), vol.29, no.128, p.159-81 (Nov. 1982). [received: May 1983]
Describes characteristics of ELF hiss electric fields observed in the topside ionosphere by using electric field frequency-time spectra (50 Hz-30 kHz) received from ISIS-1 and -2 at Kashima station, Japan. The characteristics of ELF hiss obtained from ELF electric field data of ISIS-1 and -2 are compared with those of the plasmaspheric hiss and of the inner zone hiss. The differences between the results are discussed. (16 refs.)

73961 **Non-LTE astrophysics and the origin of high energy cosmic rays.** S.A.Colgate (Los Alamos Nat. Lab., Los Alamos, NM, USA).
AIP Conf. Proc. (USA), no.96, p.306-12 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).
The most startling aspect of the Universe is the departure from the nonuniform, nonthermodynamic equilibrium state. Mass concentrations and high energy electromagnetic quanta and particles are the primary examples. Of these various departures the extremum of nonexplained phenomena is still the acceleration of cosmic rays. The usual explanation involving multiple mechanisms contributing to various regions of the spectrum is suggested as most unlikely. In particular, the suggestion that the acceleration of the very highest energy cosmic rays is by distant active galactic nuclei is shown to be untenable because of photon particle interactions. (8 refs.)

73962 **A method for determining the age of cosmic rays in the galaxy.** Huang Yong-nian (Inst. of Space Phys., Acad. Sinica, Shanghai, China).
Chin. Phys. (USA), vol.3, no.1, p.79-85 (Jan.-March 1983). [received: May 1983]
Presents a way to determine the age of cosmic rays in the galaxy by using the data on the ratio of the abundance of manganese to iron from the Danish-French isotope instrument on board HEAO-3. The leaky-box model and the exponential path-length distribution have been adopted. (6 refs.)

73963 Pion-to-proton ratio for unaccompanied high-energy cosmic-ray hadrons at mountain altitude using transition-radiation detector. R.W.Ellsworth, A.S.Ito, J.R.MacFall, F.Siohan, R.E.Streitmatter, S.C.Tonwar, P.R.Viswanath, G.B.Yodh (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).
Phys. Rev. D (USA), vol.27, no.9, p.2041-55 (1 May 1983).
A transition-radiation (TR) detector, consisting of 24 modules of styrofoam radiators and multiwire proportional chambers, and an ionization calorimeter have been used to measure the pion-to-proton ratio among the unaccompanied cosmic-ray hadrons at a mountain altitude of 730 g cm^{-2}. Using the characteristics of the TR detector obtained from calibrations with particle beams at accelerators, the π/p ratio has been determined for cosmic-ray hadrons as $\pi/p=0.96\pm0.15$ for hadron energy$=400-800$ GeV, and $\pi/p=0.45\pm0.25$ for energy >800 GeV. Monte Carlo simulations of hadron cascades in the atmosphere using the approximate criterion of unaccompaniment suggest that the observed π/p ratio as well as the previously reported neutral-to-charge ratio can be understood by assuming a value of about $^1/_3$ for the charge exchange in nucleon-air-nucleus inelastic interactions at energies above 400 GeV. (33 refs.)

94.60 INTERPLANETARY SPACE

(see also 96.60 Solar physics)

73965 Helios 1 + Helios 2: a summary of IMF observations performed in the inner solar system during 1975-1981. U.Villante (Istituto di Fisica Univ. di L'Aquila, L'Aquila, Italy), F.Mariani, R.Cirone.
Nuovo Cimento C (Italy), vol.5C, ser.1, no.5, p.497-506 (Sept.-Oct. 1982). [received: May 1983]
The experimental observations performed by Helios 1 and Helios 2 spacecraft can be used to monitor the IMF conditions in the inner solar system ($0.3\leq r\leq0.6$ A.U.) over many years. The field orientation closely corresponds to theoretical predictions and the histograms of the distributions of the angular elements are possible more peaked around the expected values than those obtained at greater heliocentric distances. The field behaviour does not show any clear long-term variation and only supports some evidence for a field modulation in the rising part of the new solar cycle. (19 refs.)

73966 Rendezvous with Halley's Comet. R.Reinhard (ESA, Noordwijk, Netherlands).
Umschau (Germany), vol.83, no.5, p.144-9 (4 March 1983). In German.
Halley's Comet, a comet with a 76 year period, is approaching the Sun and the Earth again. The European Space Agency (ESA) wishes to make use of this rare opportunity and will send a space probe to intercept the comet in March 1986. The rendezvous is described. (3 refs.)

73967 The ERS-1 programme of the European space agency. A.Haskell (Earth Obs. Programme Office, ESA, Toulouse, France).
ESA J. (Netherlands), vol.7, no.1, p.1-13 (1983).
Describes this programme, its status, planning and objectives and provides a summary of the capabilities of the first remote-sensing satellite, ERS-1, and its ground segment. (6 refs.)

73968 Astronomy—the next space race. N.Henbest.
New Sci. (GB), vol.97, no.1351, p.896-900 (31 March 1983).
Discusses the future of space astronomy and some of the satellites planned for the next decade. (no refs.)

73969 Satellite performance reference chart 1983. W.L.Morgan.
Satell. Commun. (USA), vol.7, no.3, p.36-9 (March 1983).
Presents the third annual chart recording the state of the satellite communications business. A comparison of the three charts reveals a surprisingly rapid increase in the variety of satellites; in the quantities in each category, and even more significantly, in the radiated power from the satellites. This power increase has led to substantial reductions in cost and size of earth stations. It has also permitted a variety of new services and lays the groundwork for still additional capabilities as the power in the beams is increased further. (no refs.)

95.10C Celestial mechanics

(for dynamics and kinematics of stellar systems, see 98.10)

73970 On the bifurcations of a certain family of periodic orbits. D.C.Heggie (Inst. of Astron., Cambridge, England).
Celestial Mech. (Netherlands), vol.29, no.3, p.207-14 (March 1983).
In their numerical study of a particular family of periodic orbits in a certain potential, Contopoulos and Zikides (1980; Contopoulos, 1981) have calculated numerically successive values of the energy h at which the family becomes unstable. They showed that the ratio of successive values of $h-h_{esc}$, where h_{esc} is the energy of escape, is approximately 9.22. The author shows that the limiting ratio as $h\rightarrow h_{esc}$ is $\exp(\pi/\sqrt{2})$ in this problem, and that the limiting ratio for bifurcation of this type varies from one problem to another. (6 refs.)

73971 On the stability of close binaries in hierarchical three-body systems. I.W.Walker (Dept. of Astron., Univ. of Glasgow, Glasgow, Scotland).
Celestial Mech. (Netherlands), vol.29, no.3, p.215-28 (March 1983).
The Hill-type stability of general hierarchical three-body systems is examined analytically in the case where the total mass of the binary is small in comparison to the mass of the external body. This is compared with results derived by Szebehely (1978), Markellos and Roy (1981) in the Planet-Satellite-Sun case of the circular restricted three-body problem. It is demonstrated how the Hill-type stability is affected by the sense of revolution of the binary. The effect of the difference in longitudes of the bodies in their orbits is also examined. (7 refs.)

73972 The reduction to the rotation for planar perturbed Keplerian systems. A.Deprit (NBS, Washington, DC, USA).
Celestial Mech. (Netherlands), vol.29, no.3, p.229-47 (March 1983).
After the mean anomaly has been removed from the perturbations, the reduction Hamiltonian becomes a function over the Lie algebra determined by the infinitesimal generators associated with the dynamical symmetries of an unperturbed Keplerian system. The phase space being now the group SO(3), average motions consist of rotations, and the normalized Hamiltonian serves as a Morse function whose critical points determine the intrinsic topology of the perturbed system. (26 refs.)

73973 Solution of equations of problem of motion of a heavy rigid body about a fixed point in the Kowalevskaya's case using θ-function. F.M.El-Sabaa (Dept. of Math., Ain-Shams Univ., Cairo, Egypt).
Celestial Mech. (Netherlands), vol.29, no.3, p.249-53 (March 1983).
Equations of motion of a heavy rigid body about a fixed point in the Kowalevskaya's case are reduced to those of the plane motion of a particle under the action of potential force. In the new form of the equations of motion, elliptic coordinates λ, μ are used, and the motion has taken the Hamilton-Jacobi form. (4 refs.)

73974 The rotation number of bounded orbits in a central field. F.Puel (CNRS, Equipe de Recherche Associee, Obs. de Besancon, Besancon, France).
Celestial Mech. (Netherlands), vol.29, no.3, p.255-66 (March 1983).
After reviewing known results on bounded motions in a central field and on the angle between two consecutive apocenters the author investigates the limit of the orbits as the pericenter tends to the origin. A 'deflection' of the almost rectilinear orbits is found which depends on the shape of the potential at the origin. The author studies the rotation numbers of all bounded motions in a field homogeneous in r. Finally on a few examples the author shows how to represent the set of bounded motions in an inhomogeneous field. (10 refs.)

73975 Stability criteria in many-body systems. V. On the totality of possible hierarchical general four-body systems. I.W.Walker, A.E.Roy (Dept. of Astron., Univ. of Glasgow, Glasgow, Scotland).
Celestial Mech. (Netherlands), vol.29, no.3, p.267-94 (March 1983).
For pt.IV see ibid., vol.29, no.2, p.149-78 (1983). The stability of hierarchical many-body dynamical systems has been considered in terms of parameters which are a measure of the perturbation imposed on the disturbed Keplerian orbit of each member of a system by the other bodies present. If these parameters are small enough then the initial hierarchical order will be undisturbed for some time. In the light of this criterion the appropriate parameters for the general four-body problem are considered. Two distinct hierarchical arrangements of four-body systems are possible; these are classified and an examination of the relevant stability parameters is made in each case. It is shown how regions may be determined within which real four-body systems can exist and may be stable. It is also shown how the various types of possible systems within these regions may be identified. (7 refs.)

73976 On the double averaged three-body problem. M.Sidlichovsky (Astron. Inst., Czechoslovak Acad. of Sci., Praha, Czechoslovakia).
Celestial Mech. (Netherlands), vol.29, no.3, p.295-305 (March 1983).
The Hamiltonian of three point masses is averaged over fast variable l and l' (mean anomalies). The problem is non-planar and it is assumed that two of the bodies form a close pair (stellar three-body problem). Only terms up to the order of $(a/a')^4$ are taken into account in the Hamiltonian, where a and a' are the corresponding semi-major axes. Employing the method of elimination of the nodes, the problem may be reduced to one degree of freedom. Assuming in addition that the angular momentum of the close binary is much smaller than the angular momentum of the motion of the binary around a third body, the author solves the equation for the eccentricity changes in terms of the Jacobian elliptic functions. (6 refs.)

73977 Generalization of Szebehely's equation. G.Bozis (Dept. of Theoretical Mech., Univ. of Thessaloniki, Thessaloniki, Greece).
Celestial Mech. (Netherlands), vol.29, no.4, p.329-34 (April 1983).
Szebehely's partial differential equation for the force function $U=U(x,y)$ which gives rise to a given family of planar orbits $f(x,y)=\text{Constant}$ is generalized to account for velocity-dependent potentials $V^*=V^*(x,y,\dot{x},\dot{y})$. The new partial differential equation is quasi-linear and of the first order. An example is given and a comparison is made of the two equations. (7 refs.)

73978 Note on the relation between the equinox and Guinot's non-rotating origin. S.Aoki, H.Kinoshita (Tokyo Astron. Obs., Univ. of Tokyo, Tokyo, Japan).
Celestial Mech. (Netherlands), vol.29, no.4, p.335-60 (April 1983).
Shows that the non-rotating origin introduced by Guinot (1979) is nothing but a departure point on the movable equatorial plane, and discusses that, even if this is introduced, the uncertainty of determining the equinox correction cannot be avoided. A difficulty still remains, furthermore, when one takes into account nutational effect, since the (true) departure point is not fixed but moves in RA direction on the equator secularly and periodically with respect to space. The authors discuss thoroughly the interrelation between old and new concepts, and propose an exact treatment sufficient enough for the precise requirements. (23 refs.)

73979 Lagrange variational equations from Hori's method for canonical systems. W.Sessin (Dept. de Astron., Inst. Tecnologico de Aeronautica, Sao Jose dos Campos, Sao Paulo, Brazil).
Celestial Mech. (Netherlands), vol.29, no.4, p.361-6 (April 1983).
Hori (1966), in his method for canonical systems, introduces a parameter τ through an auxiliary system of differential equations. The solutions of this system depend on the parameter and constants of integration. Lagrange variational equations for the study of the time dependence of this parameter and of these constants are derived. These variational equations determine how the solutions of the auxiliary system will vary when higher order perturbations are considered. A set of Jacobi's canonical variables may be associated to the constants and parameter of the auxiliary system that reduces Lagrange variational equations to a canonical form. (3 refs.)

73980 Impossibility of the capture of retrograde satellites in the restricted three-body problem. K.Tanikawa (Internat. Latitude Obs. of Mizusawa, Iwate, Japan).
Celestial Mech. (Netherlands), vol.29, no.4, p.367-402 (April 1983).
Impossibility of the capture of retrograde satellites is proved in the framework of the circular planar restricted three-body problem. Motion of the third body is described in Birkhoff's variables. First, various kinds of retrograde orbits around one of the primaries are defined. Among them are captured retrograde orbits and retrograde satellite orbits. Second, the surface of section and surface transformation are defined in the three dimensional manifold, in which the motion of the third body is possible for a fixed value of the Jacobi constant. Third, the surface transformation is shown to be homeomorphic and measure-preserving. Finally, with the use of these properties of surface transformation, impossibility of the capture is shown. (5 refs.)

73981 Calculation of ephemerides for libration points. L.G.Luk'yanov, G.L.Suchkin, G.I.Shirmin (P.K. Shternberg State Astron. Inst., USSR).
Sol. Syst. Res. (USA), vol.16, no.3, p.147-52 (July-Sept. 1982). Translation of: *Astron. Vestn. (USSR)*, vol.16, no.3, p.183-9 (July-Sept. 1982). [received: April 1983]
A short review is given of papers that are devoted to the astronomical applications of the Lagrangian solutions of the restricted three-body problem and to observations of objects in the vicinity of the libration points of various bodies of the Solar System. Equations are shown for calculating the equatorial and horizon spherical coordinates of the libration points of the Earth-Moon and Sun-Earth systems for specific coordinates of the Moon and Sun. (19 refs.)

About the non-existence of additional analytical integral in the problem of a satellite's motion under the gravitational attraction of a triaxial rigid body ....See Entry 74005

95.30 FUNDAMENTAL ASPECTS OF ASTROPHYSICS

73982 Transfer of polarized radiation in astronomical masers. L.R.Western, W.D.Watson (Univ. of Illinois, Urbana, IL, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.849-59 (15 May 1983).
Equations are obtained that describe the transfer of the linearly polarized radiation that occurs naturally in two- and three-dimensional astronomical masers. Although restricted, the geometries to which these equations apply to include disks, spheres, and shells, the properties of which will provide a useful indication of what might be expected for less idealized geometries. The equations are derived for circumstances in which magnetic fields can be ignored. The transfer equations presented here include both polarization and intersecting maser rays. The transfer equations are in a form that is amenable to the numerical integrations which must be performed to determine the net linear polarizations and apparent sizes that result for actual maser models. It can, however, be seen from the transfer equations themselves that the growth of particular linear polarizations can be strongly preferred in masering regions that are not isotropic. The possibility then exists that substantial linear polarization can be produced by natural asymmetries in the geometry without the need for magnetic fields or pumping mechanisms that select magnetic substates. (11 refs.)

73983 Energy dynamics in stressed magnetic fields: the filamentation and flare instabilities. G.Van Hoven, R.S.Steinolfson, T.Tachi (Dept. of Phys., Univ. of California, Irvine, CA, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.860-4 (15 May 1983).
The thermal and tearing instabilities are believed to be the two primary temperature modification mechanisms in sheared astrophysical magnetic fields. The former gives rise to the formation of cool filaments and the latter to the release of magnetic energy. It has long been known that these processes are interrelated, most conspicuously in the case of the solar corona where prominences often precede flares within the same magnetic structure. It is also clear, from first principles, that the energy transport underlying the thermal instability should have a strong effect on the resistivity which facilitates magnetic tearing, and that the energy release of the latter should effect the temperature drop of the former. Some results of the first calculations which attempt to unify the dynamic treatment of these two coexisting instabilities are described. Growth rates as a function of resistivity, and examples of the primary mode structures are provided, along with a discussion of some critical aspects of the interaction of these two astrophysical energy flux mechanisms. (13 refs.)

73984 On the first-order smoothing expression for the α-effect in dynamo theory. B.R.Durney (Sacramento Peak Obs., Sunspot, NM, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.822-4 (15 April 1983).
The well-known expression for the α-term in mean field electrodynamics derived by Krause (1976) does not vanish in the Boussinesq approximation if curvature effects are neglected. The author derives an expression for α which satisfies this constraint and discusses its uniqueness. (26 refs.)

73985 Decay of long-lived particles in the early Universe. J.Silk (Dept. of Astron., Univ. of California, Berkeley, CA, USA), A.Stebbins.
Astrophys. J. (USA), vol.269, no.1, pt.1, p.1-12 (1 June 1983).
Radiative decay of massive fermions can distort the cosmic background radiation. Constraints are derived on the masses and lifetimes of such particles which decoupled when the effective number of species in equilibrium was large (~ 50). These have specific significance for particles predicted by supersymmetry theories and for right-handed neutrinos. Implications for galaxy formation theory are noted. (22 refs.)

73986 Relativistic thermal plasmas: effects of magnetic fields. S.Araki (Dept. of Phys., MIT, Cambridgbe, MA, USA).
Astrophys. J. (USA), vol.269, no.1, pt.1, p.49-56 (1 June 1983).
Investigates the equilibria of relativistic, thermal plasmas, taking into account electron-positron creation and annihilation, photon production by internal processes, and photon production by a magnetic field B. Inclusion of the latter extends previous work on such plasmas. Synchrotron photons produced by B are Compton scattered up to high energies, where they produce pairs or emerge as X-rays or γ-rays. Solutions are determined by three dimesionless parameters, which may be taken as the dimensionless temperature, $T_* \equiv kT/mc^2$; the energy spectral index, $x \equiv \ln(1/\tau_{th})/\ln(16T_*^2)$, where τ_{th} is the Thomson scattering depth; and a magnetic parameter, $\beta(B, T_*, s, R)$, where R is the size of the medium. (14 refs.)

73987 Effects of the Kelvin-Helmholtz surface instability on supersonic jets. P.E.Hardee (Dept. of Phys. & Astron., Univ. of Alabama, University, AL, USA).
Astrophys. J. (USA), vol.269, no.1, pt.1, p.94-101 (1 June 1983).
Performs an exact numerical calculation of the linear growth and phase velocity of Kelvin-Helmholtz unstable wave modes on a supersonic jet of cylindrical cross section. An expression for the maximally unstable wavenumber of each wave mode is found. Provided a sharp velocity discontinuity exists, all wave modes are unstable. A combination of rapid jet expansion and velocity shear across a jet can effectively stabilize all wave modes. The more likely case of slow jet expansion and of velocity shear at the jet surface allows wave modes with maximally unstable wavelength longer than or on the order of the jet radius to grow. The relative energy in different wave modes and effect on the jet is investigated. Energy input into a jet resulting from surface instability is discussed and the effect on source morphology is considered. (25 refs.)

73988 Magnetic fields in astrophysics. R.D.Blandford (Theoretical Astrophys., Caltech, Pasadena, CA, USA).
Astron. J. (USA), vol.88, no.3, p.245-52 (March 1983).
Magnetic fields play many important roles in interpretative models of astronomical phenomena. They can provide powerful diagnostics of the physical conditions within active objects. They may mediate and collimate the energy release from a deep gravitational potential well. On a microscopic level, they may control the transport properties of astrophysical plasmas with large-scale thermal and dynamical consequences. Some of these facets of the behaviour of magnetic fields are illustrated with examples drawn mainly from contemporary high-energy astrophysics. In particular, the author presents the case that most double radio sources are powered by the electromagnetic or hydromagnetic extraction of energy from a spinning massive black hole and accretion disk and subsequently collimated by the pinching action of toroidal field wrapped around the jet. The origin of neutron star magnetic fields is also discussed and it is argued that the magnetization can be generated thermoelectrically by the heat flux escaping from the interior of the star. (35 refs.)

73989 Stability of an astrophysical plasma near the onset of electron runaway. J.S.Kaastra (Sterrekundig Inst., Rijksuniv. Utrecht, Utrecht, Netherlands).
J. Plasma Phys. (GB), vol.29, pt.2, p.287-98 (April 1983).
The time-dependent behaviour of a homogeneous plasma in a weak electric field near the onset of runaway of electrons is studied for astrophysical applications. The relativistic Boltzmann equation is used to calculate the particle distribution function. It is shown that the plasma is stable against electric field fluctuations in the onset region for runaway, provided that the global behaviour of the system is determined by the magnetic field structure. (10 refs.)

73990 On frequency waves. Ting Ou-Yang (Inst. of Geophys., State Seismological Bur., Beijing, China).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.5, p.457-63 (May 1983).
A new type of wave existing in the frequency domain is deduced and named a frequency wave. For a homogeneous medium, the authors have obtained the approximate and rigorous solutions of a frequency shift equation for plane radiation under some special, one-sided or two-sided frequency shift conditions. 95.55 ASTRONOMICAL INSTRUMENTS

73991 A chopping secondary for the 74-inch. D.T.Ellis, I.S.Glass, E.F.Sommeregger, J.D.Wilson (South African Astron. Obs., Observatory, S Africa).
Mon. Notes Astron. Soc. South Afr. (S. Africa), vol.41, no.7-10, p.81-4 (Oct. 1982). [received: April 1983]
The advantages of chopping secondary systems for infrared observations are outlined. A detailed description of the installation at Sutherland is given together with some details of its performance. (3 refs.)

73992 Images in astronomy. L.Vigroux (CEA, Saclay, France).
Recherche (France), vol.14, no.144, p.626-34 (May 1983). In French.
To observe objects which are weaker and weaker astronomers always seek to improve their observation methods. The work in the last 10 years gives rise to the need to describe a new generation of telescopes. These obtain images over practically all of the spectra of electromagnetic radiation. The development of various kinds of telescopes is outlined very briefly, together with the effects of the atmosphere on astronomy in general. Various stages in the battle against these defects are described in some detail. Then follows a section on radio astronomy—said to have given astronomers new eyes. (17 refs.) *G.V.D.*

73993 Computer systems at the Multiple Mirror Telescope. W.P.Goring (Multiple Mirror Telescope Obs., Tucson, AZ, USA).
Second Annual Phoenix Conference on Computers and Communications. 1983 Conference Proceedings, Phoenix, AZ, USA, 14-16 March 1983 (New York, USA: IEEE 1983), p.306-10
The world's third largest telescope in total light collecting area, the multiple mirror telescope (MMT) atop Mt. Hopkins in southern Arizona has the largest mirror edge-to-edge diameter of any optical telescope ever built. As integral to the success of the telescope as its mirrors, are its several computer systems, without which the MMT could not perform its state of the art observations. One computer system controls the pointing and tracking motion of the altitude over azimuth telescope mount to high precision. The 'telescope coalignment system' superposes the images from each of the telescopes in a common focal plane by tilting the telescope secondary mirrors. The third computer on the mountain controls the astronomical instrument mounted on the telescope and records the data collected by that instrument. (no refs.)

73994 Upgrading the 11-meter antenna of the National Radio Astronomy Observatory. J.W.Findlay, J.M.Payne (Nat. Radio Astron. Obs., Greenbank, WV, USA).
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.55-9 part 1
The 11-meter antenna on Kitt Peak, near Tucson, Arizona, has now been in operation for more than 15 years. Many astronomers have used it to make observations at millimeter wavelengths; it is probably the most used and most successful instrument of its kind. However, it suffers from less than ideal pointing behavior and its surface accuracy has an RMS value of about 175 μm. These facts have made the instrument of little use at wavelengths less than about 2 mm (150 GHz); in particular, it cannot be used well in the atmospheric window centered on 1.2 mm wavelength (250 GHz). The telescope is in a large astrodome with a dome door just large enough to allow a 12-meter diameter reflector to see through it, so the project described is planned to increase the reflector size and make it more precise and stable. The authors give most attention to the new reflector surface and how it has been measured and set. The design of the reflector support structure and the properties of the radiometers installed on the telescope are described. (4 refs.)

73995 Radioastronomy antennas for 3K cosmic radiation measurements. P.Bielli, E.Pagana (CSELT, Turin, Italy), G.Sironi.
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.503-7 part 1
Improves the radiation performance of the horn reflector antenna by corrugating the conical waveguide. Also the feeding corrugated waveguide allows one to reduce the overall size of the horn reflector since the increase of the waveguide flare angle up to 60° does not affect the electrical performance. (4 refs.)

95.65 AUXILIARY AND RECORDING INSTRUMENTS

73996 The SAAO filter-wheel spectrometer. I.S.Glass (South African Astron. Obs., Observatory, S Africa).
Mon. Notes Astron. Soc. South Afr. (S. Africa), vol.41, no.7-10, p.78-81 (Oct. 1982). [received: April 1983]
The design of an infrared spectrometer having 1% resolution and covering the range 1.2 to 4.1 μm is described. (3 refs.)

95.70 OTHER INSTRUMENTATION AND TECHNIQUES

(inc. clocks, frequency standards)

73997 Cosmic ray physics underground: some puzzles. M.R.Krishnaswamy, M.G.K.Menon, N.K.Mondal, V.S.Narasimham, B.V.Sreekantan (Tata Inst. of Fundamental Res., Bombay, India), Y.Hayashi, N.Ito, S.Kawakami, S.Miyake.
AIP Conf. Proc. (USA), no.96, p.265-72 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).
A series of experiments has been carried out since 1961 at depths of 750 to 8400 hg/cm^2 in the Kolar Gold Mines and the general features of atmospheric muons and neutrinos have been studied. However, there are some problems which are incompletely understood and some of the events observed suggest the existence of new phenomena caused by unknown particles or processes. The authors point out some problems observed at these great depths which are relevant to the prompt muons in hadronic collisions; the increase of average transverse momentum in the very high energy region, muon bundles, Kolar events, large electromagnetic cascades, and so on. (8 refs.)

95.75 TECHNIQUES OF OBSERVATION AND REDUCTION

73998 Photography in the Washington system. D.Geisler, S.Kapranidis (Astron. Dept., Univ. of Washington, Seattle, WA, USA).
Astron. J. (USA), vol.88, no.3, p.461-8 (March 1983).
The Washington photometric system has been established photographically. For a sample of 37 stars in the cluster NGC 6882/5, the mean photographic and photoelectric colors differ by typically 0.02-0.03 m. However, this difference precludes the use of photography to determine accurate abundances for individual stars. The accuracy becomes acceptable when several stars are averaged. Abundances determined from *C-M* are both more precise and in better agreement with photoelectric values than those determined from $M-T_1$. Effective temperature can be determined to within 150-200K of the photoelectric value. Solid-state detectors of sufficient photometric precision will greatly improve the utility of two-dimensional Washington photometry. (11 refs.)

73999 Catalogue of 20457 star positions obtained by photography in the declination zone −48° to −54° (1950). H.Eichhorn (Dept. of Astron., Univ. of Florida, Gainesville, FL, USA), W.D.Googe, C.F.Lukac, J.K.Murphy.
Astron. J. (USA), vol.88, no.4, p.546-58 (April 1983).
The methods for constructing a catalogue of 20457 star positions for the epoch 1964 between −48° and −54° declination are described. The positions were obtained by the overlap method, and images generated by a coarse diffraction grating were employed to control magnitude-related effects on the positions. A selection of about two faint AC stars per square degree was included to serve as material for the eventual determination of magnitude effects on the AC positions. The standard error of a catalogued position estimate based on two images is 0.12″ in either coordinate. (23 refs.)

95.85 CATALOGUES, ATLASES ETC

74000 **An atlas of H II regions in 125 galaxies.** P.W.Hodge (Astron. Dept., Univ. of Washington, Seattle, WA, USA), R.C.Kennicutt,Jr..
Astron. J. (USA), vol.88, no.3, p.296-328 (March 1983).
Data on the positions of 10632 H II regions in 125 galaxies are presented in the form of Hα photographs, numbered charts, and tables of off-set positions. Complete data are printed for ten examples, NGC 1232, NGC 2403, NGC 3031, NGC 4254, NGC 4303, NGC 4321, NGC 4535, NGC 4631, NGC 6946, and IC 342, while the data for the remaining galaxies are available

from the American Institute of Physics' Physics Auxiliary Publication Service. (9 refs.)

74001 The Asiago Catalogue of Quasi Stellar Objects. C.Barbieri, M.Capaccioli, S.Cristiani, G.Nardon, A.Omizzolo (Istituto di Astron., Univ. di Padova, Padova, Italy).
Mem. Soc. Astron. Ital. (Italy), vol.53, no.3, p.511-23 (1982). In Italian.
A catalogue containing QSOs known from literature published before December 31, 1981, has been compiled at the Asiago Observatory. Basic data (names, equatorial and galactic coordinates, photometry, redshifts, information on radio emission, variability, morphology, presence of absorption lines, X-ray emission and finding charts), individual notes and further details concerning absorption spectra as well as X-ray properties are provided for 2004 QSOs. Cross-reference tables are also supplied in order to make easier the correct identification of the objects. (8 refs.)

Catalogue of 20457 star positions obtained by photography in the declination zone −48° to −54° (1950) .... See Entry 73999

96.00 SOLAR SYSTEM

96.20 MOON

74002 Optical investigations of the Moon and spectrophotometric standards. L.A.Akimov, E.P.Gol'dberg, S.Z.Omarov, N.V.Opanasenko, V.A.Psarev, Yu.G.Shkuratov (Kharkov Astron. Obs., A.M. Gor'kii State Univ., USSR).
Sol. Syst. Res. (USA), vol.16, no.3, p.121-6 (July-Sept. 1982). Translation of: *Astron. Vestn. (USSR)*, vol.16, no.3, p.153-8 (July-Sept. 1982). [received: April 1983]
Data on the spectral and phase variations of the brightness factor for two small lunar areas (the centers of the craters Plato and Le Monnier) are given (no worse than 5% accuracy). It is proposed to use these as standard data in those astrophysical investigations where spectrophotometric tie-ins to the Moon are convenient. (25 refs.)

74003 Problem of the global asymmetry of the lunar sphere. M.Yu.Shevchenko (P.K. Shternberg State Astron. Inst., USSR).
Sol. Syst. Res. (USA), vol.16, no.3, p.127-32 (July-Sept. 1982). Translation of: *Astron. Vestn. (USSR)*, vol.16, no.3, p.159-65 (July-Sept. 1982). [received: April 1983]
The statistical distribution over the surface of the Moon of various optical and morphological parameters is investigated separately for the western and eastern hemispheres. The obtained results indicate that, along with the well-known asymmetries of the nearside and farside hemispheres, there is a noticeable west-east asymmetry of the lunar sphere in all these parameters. (16 refs.)

96.30 PLANETS AND SATELLITES

(exc. the Moon; for celestial mechanics, see 95.10; for Earth as an astronomical body, see 91. Geophysics)

74004 Report of the IAU Working Group on Cartographic Coordinates and Rotational Elements of the Planets and Satellites: 1982. M.E.Davies (Rand Corp., Santa Monica, CA, USA), V.K.Abalakin, J.H.Lieske, P.K.Seidelmann, A.T.Sinclair, A.M.Sinzi, B.A.Smith, Y.S.Tjuflin.
Celestial Mech. (Netherlands), vol.29, no.4, p.309-21 (April 1983).
Discusses the report of the IAU Working Group on Cartographic Coordinates and Rotational Elements of the Planets and Satellites as presented at the XVIII General Assembly held at Patras, Greece, 1982. Tables give the recommended values for the direction of the north poles of rotation and the prime meridians of the planets and satellites referred to both the B1950 and J2000 standard coordinate systems. Reference surfaces for mapping these bodies are described. An appendix discusses the principal changes to the tables since 1979. (7 refs.)

74005 About the non-existence of additional analytical integral in the problem of a satellite's motion under the gravitational attraction of a triaxial rigid body. A.H.Borham (Dept. of Theoretical Mech., Moscow State Univ., Moscow, USSR).
Celestial Mech. (Netherlands), vol.29, no.4, p.323-8 (April 1983).
Poincare's (1971) method is developed to prove the non-existence of additional analytical integral in the degeneration case. (3 refs.)

74006 Thick shell tectonics on one-plate planets: applications to Mars. W.B.Banerdt (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA), R.J.Phillips, N.H.Sleep, R.S.Saunders.
J. Geophys. Res. (USA), vol.87, no.B12, p.9723-33 (30 Nov. 1982). [received: May 1983]
A theory for stress distributions in thick lithospheric shells on one-plate planets is developed based on the zero frequency equations of a self-gravitating elastic spherical shell overlying a strengthless fluid. Stress distributions in lithospheres are reviewed for both the compensated and flexural modes. In the former case, surface stresses only depend on surface topography, while for the latter case, it is shown for long wavelengths that stress trajectories are mainly dependent on the lithospheric lateral density distribution and not on elastic properties. Computational analyses are carried out for Mars, and it is found that isostatically compensated models correctly predict the graben structure in the immediate Tharsis region and a flexural loading model is satisfactory in explaining the graben in the regions surrounding Tharsis. A three-stage model is hypothesized for the evolution of Tharsis: isostasy with north-south graben formation on Tharsis, followed by flexural loading and radial graben formation on the perimeter of Tharsis, followed by a last stage of loading with little or no regional deformation. (37 refs.)

Impossibility of the capture of retrograde satellites in the restricted three-body problem .... See Entry 73980

96.30E Venus

74007 Mechanisms for lithospheric heat transport on Venus: implications for tectonic style and volcanism. S.C.Solomon (Dept. of Earth & Planetary Sci., MIT, Cambridge, MA, USA), J.W.Head.
J. Geophys. Res. (USA), vol.87, no.B11, p.9236-46 (10 Nov. 1982). [received: May 1983]
The tectonic and volcanic characteristics of the surface of Venus are poorly known, but these characteristics must be closely related to the mechanism by which Venus rids itself of internal heat. On the other solid planets and satellites of the solar system, lithospheric heat transport is dominated by one of three mechanisms: (1) plate recycling, (2) lithospheric conduction, and (3) hot spot volcanism. The authors evaluate each mechanism as a candidate for the dominant mode of lithospheric heat transfer on Venus, and explores the implications of each mechanism for the interpretation of Venus surface features. Despite claims made to the contrary in the literature, plate recycling on Venus cannot be excluded the basis of either theoretical arguments or present observations on topography and radar backscatter. Landforms resulting from plate convergence and divergence on Venus would differ substantially from those on the Earth because of the high surface temperature and the absence of oceans on Venus, the lack of free or hydrated water in subducted material, the possibility that subduction would more commonly be accompanied by lithospheric delamination, and the rapid spreading rates that would be required if plate recycling removes a significant fraction of the internal heat. The strongest conclusion to emerge from this evaluation is that most of the major topographic features and probably many of the surface geological units on Venus are young by comparison with the surfaces of the smaller terrestrial planets. (99 refs.)

74008 Panoramas of the Venera-13 and Venera-14 landing sites (a preliminary analysis). K.P.Florenskii, A.T.Bazilevskii, A.S.Selivanov (V.I. Vernadskii Inst. of Geochem. & Analytical Chem., Acad. of Sci., USSR).
Sol. Syst. Res. (USA), vol.16, no.3, p.97-107 (July-Sept. 1982). Translation of: *Astron. Vestn. (USSR)*, vol.16, no.3, p.131-8 (July-Sept. 1982). [received: April 1983]
Analysis of the panoramas has shown that rocks with a thin horizontal layering have developed at the Venera-13 and Venera-14 landing sites. The characteristic morphological features of these rocks are similar to those for rocks found at the Venera-9 and Venera-10 landing sites, and they offer grounds for assuming a volcanic-sedimentary nature of these formations. The age of the rocks is unknown. (14 refs.)

74009 Investigation of Venus with Venera-13 and -14 probes: first data on composition of rocks. Yu.A.Surkov, O.P.Shcheglov, L.P.Moskaleva, V.P.Kharyukova, O.S.Manvelyan, V.S.Kirichenko, A.D.Dudin (V.I. Vernadskii Inst. of Geochem. & Analytic Chem., USSR).
Sol. Syst. Res. (USA), vol.16, no.3, p.107-21 (July-Sept. 1982). Translation of: *Astron. Vestn. (USSR)*, vol.16, no.3, p.139-52 (July-Sept. 1982). [received: April 1983]
Elements composing the rocks on Venus have been determined. The determination of the composition of the rocks was carried out in the areas where the Venera-13 and -14 probes landed. The samples of rocks for analysis were selected with the help of a special soil-sampling device and analysed by X radiometry. The analysis of rocks was done in the most typical of the regions of Venus: a hilly upland (Venera 13) and a smooth lowland (Venera 14). The composition of the rocks in the area of Venera 13s landing turned out to be similar to the potash-alkali basalts, and the composition of the rocks in the area of Venera 14s landing was similar to the tholeitic basalts of the Earth's crust. A comparison of the composition of typical rocks of Venus with that of rocks of analogous structural-morphological areas of the Earth indicates several differences in the formation of the surface and crust of these planets. (14 refs.)

96.30G Mars

74010 Gravity field model of Mars in spherical harmonics up to degree and order eighteen. G.Balmino (Bureau Gravimetrique Internat., Toulouse, France), B.Moynot, N.Vales.
J. Geophys. Res. (USA), vol.87, no.B12, p.9735-46 (30 Nov. 1982). [received: May 1983]
A new model of Mars gravity field in spherical harmonics up to eighteenth degree and order is computed from all available Doppler tracking data of Mariner 9 and Viking 1 and 2 orbiters. It represents an achievement in the knowledge of Mars global gravitational potential, since no more data will be available for such a derivation before the next mission to the planet. The model is extensively tested from the point of view of orbit representation over periods of time ranging from a few hours to 12 days, and it is currently used for geophysical studies of the Martian lithosphere. (6 refs.)

74011 New radar-derived topography for the northern hemisphere of Mars. G.S.Downs (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA), P.J.Mouginis-Mark, S.H.Zisk, T.W.Thompson.
J. Geophys. Res. (USA), vol.87, no.B12, p.9747-54 (30 Nov. 1982). [received: May 1983]
Earth-based radar altimetry data for the northern equatorial belt of Mars (6°S-23°N) have recently been reduced to a common basis corresponding to the 6.1-mbar reference surface. A first look at these data indicates that the elevations of Tharsis, Elysium, and Lunae Planum are lower (by 2-5 km) than has been suggested by previous estimates. These differences show that the required amount of tectonic uplift (or constructional volcanism) for each area is less than has been previously envisioned. Atmospheric or surficial conditions are suggested which may explain the discrepancies between the radar topography and elevations measured by other techniques. The topographies of Chryse Planitia, Syrtis Major, and Valles Marineris are also described. (30 refs.)

74012 Evolution of the Tharsis province of Mars: the importance of heterogeneous lithospheric thickness and volcanic construction. S.C.Solomon (Dept. of Earth & Planetary Sci., MIT, Cambridge, MA, USA), J.W.Head.
J. Geophys. Res. (USA), vol.87, no.B12, p.9755-74 (30 Nov. 1982). [received: May 1983]
The traditional explanation of the Tharsis province is that uplift of the lithosphere caused by a thermal, chemical, or dynamical anomaly in the Martian mantle or crust led to lithospheric fracturing and to the later volcanic emplacement of thin plains units and large shields. By this explanation the majority of the topographic anomaly is due to uplift. The authors propose a new mode for the origin and evolution of the Tharsis province which emphasizes that the topography of Tharsis may be produced largely by construction, rather than uplift. The model is based on the premise that the elastic lithosphere of Mars was laterally heterogeneous early in Martian history. Stress due to both global and local causes was concentrated in zones of thin lithosphere. As a result, fracturing was also concentrated in such zones and favored localization of volcanism by providing access to the surface for mantle-derived magma. The heating associated with volcanism maintained the lithosphere locally thin, so that further fracturing and volcanism were concentrated in the same area. The Tharsis rise was thus built primarily by volcanic construction. Most visible tectonic features, by this model, were produced by the response of the lithosphere to loading, not by uplift. (109 refs.)

74013 Tectonic history of the Tharsis region, Mars. J.B.Plescia (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA), R.S.Saunders.
J. Geophys. Res. (USA), vol.87; no.B12, p.9775-91 (30 Nov. 1982). [received: May 1983]
The faults of the Tharsis region of Mars have been mapped and delineated on the basis of age. The orientation of each group of faults was analyzed to determine if they were radial to a point. The results indicate that there are at least four discrete centers of faulting within the Tharsis area which are of significantly different age. The four centers proposed are, from oldest to youngest, (1) in the Thaumasia highlands, (2) in northern Syria Planum, and finally, (3) and (4) near Pavonis Mons, While episodes 3 and 4 occupy the same geographic position, they are separated in time by the development of the Tharsis lava plains and shields. Each episode of tectonism was separated from the next by a period of major basaltic volcanism. (40 refs.)

74014 The role in lithospheric stress in the support of the Tharsis rise. R.J.Willemann, D.L.Turcotte (Dept. of Geological Sci., Cornell Univ., Ithaca, NY, USA).
J. Geophys. Res. (USA), vol.87, no.B12, p.9793-801 (30 Nov. 1982). [received: May 1983]
The Tharsis rise on Mars is a broad topographic high covered by volcanic plains and capped by large volcanoes. The geoid high associated with Tharsis shows that shallow isostatic compensation is not complete. The authors hypothesize that the Tharsis rise can be approximated as an axisymmetrical igneous construct. Linear theory for the deflection of planetary lithospheres is used to show that the lithospheric stresses required partially to support the construct are reasonable and consistent with the observed radial grabens around Tharsis. The computed thickness of the elastic lithosphere is between 110 and 260 km depending on the assumed values for crustal thickness and crustal density. The computed thickness of the Tharsis load is between 40 and 70 km. The contribution of Tharsis to the gravitational flattening of Mars is computed. The tectonics of the Tharsis region are briefly reviewed. (20 refs.)

74015 The structure and evolution of ancient impact basins on Mars. P.H.Schultz (Lunar & Planetary Inst., Houston, TX, USA), R.A.Schultz.
J. Geophys. Res. (USA), vol.87, no.B12, p.9803-20 (30 Nov. 1982). [received: May 1983]
The number of Martian impact basins, once thought deficient owing to a low number of impactors, has been significantly increased through the identification of structural imprints that remains even after nearly complete erasure of basin massifs. Five ancient multiringed impact basins are selected for detailed study and exhibit a systematic pattern of rejuvenation of the multiring plan through endogenic modification. Concentric zones of unstable terrain are believed to reflect deep-seated, impact-related fractures that have localized regional igneous processes in a manner analogous with the basin-controlled distribution of basalts on the Moon. Most Martian outflow channels are found to originate along the unstable ring zones. Hydrothermal melting and temporary confinement of channel source materials at sites analogous to lunar sinuous rille source regions are proposed to play an important role in the distribution of Nartian outflow channels. Ancient basins also can be delineated by the concentric pattern of topographically and structurally controlled narrow valley networks that are particularly abundant along the outer rings where basin ejecta deposits occur. The systematic patterns of valley networks, stable and unstable annuli, scarps, and massifs provide bases for interpreting impact structure in general and for recognizing multiringed structures elsewhere. (32 refs.)

74016 Martian volcanic materials: preliminary thickness estimates in the eastern Tharsis region. R.A.De Hon (Dept. of Geosci., Northeast Louisiana Univ., Monroe, LA, USA).
J. Geophys. Res. (USA), vol.87, no.B12, p.9821-8 (30 Nov. 1982). [received: May 1983]
Mars displays a variety of volcanic materials from high standing constructs to smooth plains. These materials are evaluated in terms of their susceptibility to thickness determination, and a representative area is analyzed. The Martian ridged plains are much like lunar maria in both surface expression and apparent mode of emplacement. Flooded craters within the ridged plains materials provide an estimate of the thickness distribution. In the Tharsis region, ridged plains materials occur as part of the layered sequence on the east flank of the Tharsis dome. Partially buried craters indicate that the ridged plains materials ranged from zero meters thick at their eastern limit to over 1.5 km thick westward on the flank of the dome where they are overlain by younger materials. These materials are responsible for only a small portion of the total relief of the Tharsis dome. (19 refs.)

74017 Tharsis volcanoes: separation distances, relative ages, sizes, morphologies, and depths of burial. J.L.Whitford-Stark (Geology Dept., Sul Ross State Univ., Alpine, TX, USA).
J. Geophys. Res. (USA), vol.87, no.B12, p.9829-38 (30 Nov. 1982). [received: May 1983]
Network analysis indicates the separation distances of the Tharsis volcanoes to be 700 to 900 km; this is considered to be the thickness of the Tharsis thermal lithosphere or 'tectosphere' which has thickened with time. Although as a whole the Tharsis volcanoes exhibit a random distribution, preferential alignments emerge when the history of the region is divided into separate periods. The preferential alignments mimic those of fractures in the surrounding terrain. Photogeologic and morphometric data indicate that the volcanoes fall into four distinct classes: montes, tholi, paterae, and a class whose sole representative is Alba Patera. The volcanoes have been buried by lava up to about 4 km in thickness. The sizes of the volcanoes directly correlate with their separation distance from their nearest neighbors. (34 refs.)

74018 Volcanoes and volcanic provinces: Martian western hemisphere. D.H.Scott (US Geological Survey, Flagstaff, AZ, USA).
J. Geophys. Res. (USA), vol.87, no.B12, p.9839-51 (30 Nov. 1982). [received: May 1983]
The recognition of some Martian landforms as volcanoes is based on their morphology and geologic setting. Other structures, however, may exhibit classic identifying features to a varying or a less degree: these may be only considered provisionally as having a volcanic origin. Regional geologic mapping of the western hemisphere of Mars from Viking images has revealed many more probable volcanoes and volcanotectonic features than were recognized on Mariner 9 pictures. These abundant volcanoes have been assigned to several distinct provinces on the basis of their areal distribution. Although the Olympus-Tharsis region remains as the principal center of volcanism on Mars, four other important provinces are now also recognized: the lowland plains, Tempe Terra plateau, southern highlands (in the Phaethontis and Thaumasia quadrangles), and a probable ignimbrite province, situated along the highland-lowland boundary in Amazonis Planitia. (32 refs.)

74019 Syrtis Major: a low-relief volcanic shield. G.G.Schaber (US Geological Survey, Flagstaff, AZ, USA).
J. Geophys. Res. (USA), vol.87, no.B12, p.9852-66 (30 Nov. 1982). [received: May 1983]
Viking orbiter images and earth-based radar elevation data are used to document the volcanic geology of Syrtis Major and to reevaluate its physiographic setting. These data indicate that Syrtis Major is actually a very low relief, simple shield with a central caldera complex; arcuate segments of concentric grabens at the shield summit define the limits of a 280-km-diameter depression that is thought to have been created by foundering of a magma chamber. Lava flows with well-defined scarps are associated with two summit calderas; fissures and lava tubes are recognized on the shield flanks. Compressional stresses acting on the shield were apparently greatest following the deposition of the ridged-plains unit but continued at a somewhat reduced rate after deposition of the younger lavas. The extremely low-relief shield of the Syrtis Major as well as other volcanic plains of intermediate age in the eastern hemisphere of Mars is in striking contrast to the giant shields of Tharsis Montes. (34 refs.)

74020 Subkilometer Martian volcanoes: properties and possible terrestrial analogs. H.Frey, M.Jarosewich (Geophys. Branch, NASA Goddard Space Flight Center, Greenbelt, MD, USA).
J. Geophys. Res. (USA), vol.87, no.B12, p.9867-79 (30 Nov. 1982). [received: May 1983]
Kilometer to subkilometer cones with large central craters are the most numerous volcanic structures in the northern plains of Mars. Based on examination of more than 12000 high resolution Viking orbiter images, most of these very small cones are located in parts of Eastern Acidalia and Utopia-Isidis-Elysium Planitia. Measurements of base and pit diameter for some 2000 well-resolved features show small variations in the histogram of base diameters between and within regions but remarkable similarity in the distribution of crater/cone diameter ratios. This suggests that the small cones had a similar origin with only minor variations in local conditions. The Acidalia cones are generally larger, more widely distributed, and occur on a greater variety of terrains than those in Utopia-Isidis-Elysium. Based on morphology, distribution, and the crater/cone ratio histograms the smallest Martian cones may be similar to Icelandic pseudocraters. (16 refs.)

74021 Absence of silicic volcanism on Mars: implications for crustal composition and volatile abundance. P.W.Francis (Lunar & Planetary Inst., Houston, TX, USA), C.A.Wood.
J. Geophys. Res. (USA), vol.87, no.B12, p.9881-9 (30 Nov. 1982). [received: May 1983]
The authors believe that much of the evidence presented for large scale explosive volcanism on Mars is not convincing, and in particular that interpretation of various rock units on Mars as silicic ignimbrites is speculative and unfounded. The authors summarize the characteristics of terrestrial explosive volcanism, the resulting landforms, and the tectonic and petrologic conditions leading to their formation. With this background, the authors then discuss photogeologic evidence for some postulated examples of Martian explosive and/or silicic volcanism, examine the relevant petrological and tectonic conditions prevailing on Mars, and speculate on the significance of the apparent absence of silicic volcanism on the planet. (49 refs.)

74022 Explosive volcanism on Hecates Tholus, Mars: investigation of eruption conditions. P.J.Mouginis-Mark (Dept. of Geological Sci., Brown Univ., Providence, RI, USA), L.Wilson, J.W.Head,III..
J. Geophys. Res. (USA), vol.87, no.B12, p.9890-904 (30 Nov. 1982). [received: May 1983]
Evidence is presented supporting the identification of a discrete, well-preserved air fall deposit generated by explosive volcanism on Mars. The deposit is located immediately to the west of the summit caldera of Hecates Tholus (32°N, 209°W), the northernmost of the three volcanic constructs in the Elysium Planitia region. The absence of superposed impact craters larger than the resolution limit of the Viking images indicates a very young age for this eruption, which evidently postdates even the most recent collapse episode of the Olympus Mons caldera (~300 MY BP; Neukum and Hiller (1981)). From the distribution of craters smaller than 2 km in diameter, it appears that the air fall material mantles an area about 50×75 km in extent to an estimated thickness of about 100 m. By adapting numerical models for terrestrial volcanic eruptions to the Martian environment, these dimensions imply an eruption cloud height of about 70 km. In order to attain such an altitude, the mass eruption rate must have been $\sim 10^7$ kg/s and the volatile content either ~1 wt.% for H_2O or ~2 wt.% for CO_2. (63 refs.)

74023 Mars: stratigraphy and gravimetry of Olympus Mons and its aureole. K.H.Hiller (Inst. fur Allgemeine und Angewandte Geologie, Ludwig-Maximilants-Univ., Munchen, Germany).
J. Geophys. Res. (USA), vol.87, no.B12, p.9905-15 (30 Nov. 1982). [received: May 1983]
Olympus Mons and its surroundings are investigated using impact crater statistics. Crater retention ages of all major geological units show that their emplacement occurred during three time intervals which are discussed. The regional stratigraphy is discussed as part of the global geological history. The question of the genesis of the aureole material is addressed by gravity models. The topographic mass of Olympus Mons contributes about 80% to the aureole gravity high northwest of the mountain. The gravity high of the entire aureole can be explained by a density model consisting of the topographic masses of Olympus Mons and the aureole materials. (20 refs.)

74024 Further evidence for a mass movement origin of the Olympus Mons aureole. R.Lopes, J.E.Guest (Univ. of London Obs., London, England), K.Hiller, G.Neukum.
J. Geophys. Res. (USA), vol.87, no.B12, p.9917-28 (30 Nov. 1982). [received: May 1983]
Analysis of the ridge, graben, and fracture patterns on the aureole material surrounding Olympus Mons lends further support to an origin by gravity sliding of the outer flanks of the shield. The patterns provide evidence of the nature of sliding, especially in the last stages of emplacement. No part of the slide need have traveled the whole extent of the aureole. For the slides to occur on a shallow slope, reduction of shear strength of the materials involved is required, possibly by melting of ground ice. Triggering mechanisms could be volcanically related Marsquakes and possibly stresses induced on the surrounding area by the growing Olumpus Mons volcano. (18 refs.)

74025 Relict drainages, conical hills, and the eolian veneer in southwest Egypt—applications to Mars. C.S.Breed, J.F.McCauley, M.J.Grolier (US Geological Survey, Flagstaff, AZ, USA).
J. Geophys. Res. (USA), vol.87, no.B12, p.9929-50 (30 Nov. 1982). [received: May 1983]
Viking images indicate that no single process is sufficient to explain the origin and evolution of Martian landforms. Landforms common to both Earth and Mars result from a complex interplay of geologic agents, including water, mass wasting, wind, and possibly ice. The relict wadis of the Gilf Kebir Plateau in southwest Egypt strongly resemble fluvial channels on Mars, parti-

cularly those of the fretted terrain. The unusual geomorphic characteristics of the Gilf region are herein interpreted as the results of an extreme eolian and mass-wasting overprint on a landscape originally carved by running water. The fluvial and mass wasting origin of the particles in the eolian deposits, the segregation of these materials according to grain size, and the migration of those particles capable of saltation to areas of accumulation in lowland basins of the Sahara are suggested as analogs for the formation and accumulation of 'sand' sheets and dunes on the northern plains and in the polar erg on Mars. (88 refs.)

74026 Ice sculpture in the Martian outflow channels. B.K.Lucchitta (US Geological Survey, Flagstaff, AZ, USA).
J. Geophys. Res. (USA), vol.87, no.B12, p.9951-73 (30 Nov. 1982). [received: May 1983]
Many landforms in Martian outflow channels have characteristics that suggest sculpture by glaciers, ice streams, or ice sheets. Viking Orbiter and terrestrial satellite images are examined at similar resolution to compare features of the Martian outflow channels to features produced by the movement of ice on Earth. Many resemblances were found. They include the anastromoses, sinuosites, and U-shaped cross profiles of valleys; hanging valleys; and linear scour marks on valley walls, grooves and ridges on valley floors, and streamlining of bedrock highs. The question of whether ice could have moved in the Martian environment is investigated. Since gradients on Martian channel floors are extremly low or even reversed, a certain thickness of ice is requried to initiate glacial motion. If ice filled the Martian channels to the level of interior plateaus, flow could have occurred, even under present climatic conditions, although warmer climates in the past would have been more favorable. Additionally, if the channel fluids were brines, ice might have been wet based and would have moved readily by slipping over the ground. (59 refs.)

74027 A model of Martian slope winds: implications for Eolian transport. J.Magalhaes, P.Gierasch (Center for Radiophys. & Space Res., Cornell Univ., Ithaca, NY, USA).
J. Geophys. Res. (USA), vol.87, no.B12, p.9975-84 (30 Nov. 1982). [received: May 1983]
Observations of dark Martian wind streaks not associated with visible topographic points of origin ('coalesced dark streaks') show these features to favor regions with slopes of 1°-10°. To investigate the circulation over such slopes, the authors adopt a Boussinesq fluid and assume a constant eddy diffusivity parameterization for small-scale mixing. The equations of motions are scaled to determine the range of slopes over which a strong local circulation due to slope winds can exist. A simple one-dimensional analytic model is solved to determine friction velocities and velocity and temperature profiles. For reasonable choices of the input parameters, the authors find friction velocities and wind velocities suggestive of active downslope eolian transport on slopes of 1°-10°. (24 refs.)

74028 Martian dust mantling and surface composition: interpretation of thermophysical properties. P.R.Christensen (Dept. of Earth & Space Sci., Univ. of California, Los Angeles, CA, USA).
J. Geophys. Res. (USA), vol.87, no.B12, p.9985-98 (30 Nov. 1982). [received: May 1983]
The surface block abundance, fine component thermal inertia, thermal emissivity, and relative atmospheric dust content are determined for selected regions on Mars, using broadband infrared spectral properties measured at 7, 9, 11, and 20 m by the Viking infrared thermal mapper (IRTM). Each of the surface and atmospheric properties produce characteristic spectral signatures which are successfully modeled. The surface is modeled by a mixture of a high-inertia 'block' component and a fine component, with wavelength dependent emissivity. The ubiquity of nonaeolian materials exposed on the surface suggests that there has not been substantial net deposition within this region. However, some dust deposition may be occurring in low-inertia regions. Observed global variations in the fine component inertia may be due to changes in the degree of bonding of the surficial material. During the relatively clear period studied, the atmospheric opacity was found to vary spatially. (40 refs.)

74029 Present wind activity on Mars: relation to large latitudinally zoned sediment deposits. P.Thomas (Lab. for Planetary Studies, Cornell Univ., Ithaca, NY, USA).
J. Geophys. Res. (USA), vol.87, no.B12, p.9999-10008 (30 Nov. 1982). [received: May 1983]
The relation of present Martian winds to large latitudinally zoned sediment deposits is investigated using global wind streak data and mapping of large sand and dust deposits. Dune sand deposits occur primarily in three latitude belts: north polar (74°-85°N), low latitude (5°N-20°S), and south polar (40°-80°S). Comparison with wind streak data shows the high-latitude dunes to be in areas of seasonally reversing winds. The present winds can form latitudinal dune belts from a variety of initial dune distributions, including uniform distribution and a polar source. The presence of dune sand within the polar layered deposits, the erosional state of the deposits, and the present surface wind flow away from the poles indicate that both polar dune concentrations have been derived from erosion of the layered deposits. (46 refs.)

74030 Rate of wind abrasion on Mars. R.Greeley (Dept. of Geology, Arizona State Univ., Tempe, AZ, USA), R.N.Leach, S.H.Williams, B.R.White, J.B.Pollack, D.H.Krinsley, J.R.Marshall.
J. Geophys. Res. (USA), vol.87, no.B12, p.100009-24 (30 Nov. 1982). [received: May 1983]
Estimation of the rate of aeolian abrasion of rocks on Mars requires knowledge of (1) particle flux (2) susceptibilities to abrasion of various rocks, and (3) wind frequencies on Mars. Fluxes and susceptibilities for a wide range of conditions were obtained in the laboratory and combined with wind data from the Viking meteorology experiment. Assuming an abundant supply of sand-sized particles, estimated rates range up to 2.1×10^{-2} cm of abrasion per year in the vicinity of Viking Lander 1. This rate is orders of magnitude too great to be in agreement with the inferred age of the surface based on models of impact crater flux. The discrepancy in the estimated rate of abrasion and the presumed old age of the surface cannot be explained easily by changes in climate or exhumation of ancient surfaces. The authors consider the primary reason to be related to the agents of abrasion. Either windblown grains are in very short supply, or the grains are ineffective as agents of abrasion. (46 refs.)

74031 Wind streaks in Tharsis and Elysium: implications for sediment transport by slope winds. S.W.Lee, P.C.Thomas, J.Veverka (Lab. for Planetary Studies, Cornell Univ., Ithaca, NY, USA).
J. Geophys. Res. (USA), vol.87, no.B12, p.10025-41 (30 Nov. 1982). [received: May 1983]
Detailed maps of wind streaks in Tharsis and Elysium have been compiled from Viking Orbiter observations spanning one complete Martian year. The streak pattern is controlled by slope winds on the central volcanoes and on the flanks of the Tharsis bulge, while the global circulation dominates in Elysium. Dust erosion by downslope wind occurs over much of Tharsis and in the vicinity of Elysium Mons: this process is effective even at the low atmospheric pressures found near the summits of the large volcanoes. Erosional streaks are largely absent in Elysium Planitia; net deposition of dust might have occurred during the period of our observations. Surface properties such as slope, thermal inertia, and roughness may influence the efficiency of slope wind production sufficiently to account for the pronounced differences in streak types and patterns present in these two regions. (40 refs.)

74032 Results of a study of the gravitational field, figure, and internal structure of Mars. G.A.Meshcheryakov, A.L.Tserklevich (Leninsky Komsomol Polytech. Inst., Lvov, Ukrainian SSR).
Sol. Syst. Res. (USA), vol.16, no.3, p.133-9 (July-Sept. 1982). Translation of: *Astron. Vestn. (USSR)*, vol.16, no.3, p.166-73 (July-Sept. 1982). [received: April 1983]
Gives consideration to some questions which arise in comparing models of the gravitational field. To address these questions, the authors determine the parameters of the figure, study their regional peculiarities, and investigate the isostatic condition and the density distribution inside the planet. (25 refs.)

96.30H Asteroids

74033 Radar observations of asteroid 1685 Toro. S.J.Ostro (Dept. of Astron., Cornell Univ., Ithaca, NY, USA), D.B.Campbell, I.I.Shapiro.
Astron. J. (USA), vol.88, no.4, p.565-76 (April 1983).
Reports results of 13-cm-wavelength radar observations of 1685 Toro conducted in July 1980 at the Arecibo Observatory. The data yield detections of radar echoes in the same sense of circular polarizations as transmitted (i.e. the SC sense) as well as in the opposite (OC) sense. The radar spectra reveal correlated, approximately twofold variations in radar cross section and spectral bandwidth as functions of rotational phase, with two maxima and two minima per rotation cycle. The estimate of the ratio of SC to OC echo power, $\mu_c=0.18\pm0.04$, suggests that most, but certainly not all, of the backscattering is due to single reflections from surface elements that are fairly smooth at decimeter scales. However, the total absence of the sharply peaked spectral signature of quasi-specular scattering requires substantial roughness at some much larger scale(s). When combined with photopolarimetric results of Dunlap et al. (1973), the observations provide constraints on Toro's size, shape, and surface properties. The maximum distance of any part of Toro's surface from the spin axis is between 2.4 and 3.4 km. The ratio of Toro's longest to shortest equatorial widths is between 1.4 and 2.2. Modeling Toro as a homogeneous scattering ellipsoid yields weighted-least-squares estimates for the lengths of the equatorial semiaxes: $a=2.60\pm0.10$ km and $b=1.68\pm0.17$ km, and a nearly Lambertian scattering law. The magnitude of the post-fit residuals suggests systematic departures of Toro from this simplified model, including a possible surface feature with enhanced radar reflectivity and depolarization. Physics of the Jovian magnetosphere ....See Entry 69806

96.30M Saturn

74034 The NH_3 spectrum in Saturn's 5 micron window. U.Fink, H.P.Larson, G.L.Bjoraker, J.R.Johnson (Lunar & Planetary Lab., Univ. of Arizona, Tucson, AZ, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.880-8 (15 May 1983).
Spectra of Saturn's 5 μm window were obtained at the Infrared Telescope Facility on Mauna Kea, Hawaii. The spectra have a resolution of 1.2 cm^{-1}, and some exhibit extremely low amounts of $\sim$300 μm ppt telluric H_2O. The Saturn spectra show absorptions by the $2\nu_2$ band of NH_3. Long-path laboratory comparison spectra of NH_3 were acquired and show considerable deviations in intensity from theoretical predictions. The calibration of Saturn's observed NH_3 features with the laboratory data gives 2.0 ± 0.5 m-amagat of NH_3 using the $2\nu_2$ Q-branch at 5.32 μm. The $R(1)$ and $R(2)$ lines yield an abundance about 3 times greater. Absorptions outside the range of the Q-branch can be accounted for by solid NH_3 of 10-20 μm equivalent path length. The origin of Saturn's 5 μm flux is mostly thermal with some admixture of solar reflected radiation. A depletion of Saturn's NH_3 abundance below the solar value is indicated, but confirmation of this conclusion will require a better understanding of the atmospheric penetration depth at 5 μm and more rigorous modeling of the spectral line formation. (28 refs.)

74035 Occultations by possible rings in Saturn's outer magnetosphere: 1982-1985. D.J.Mink (Dept. of Earth & Planetary Sci., MIT, Cambridge, MA, USA).
Astron. J. (USA), vol.88, no.4, p.559-61 (April 1983).
Analysis of Pioneer and Voyager low-energy plasma ion data has suggested the presence of particulate rings in Saturn's outer magnetosphere. Fourteen occultations of stars by these possible rings between August 1982 and December 1985 are presented. Three of these stars are also occulted by Saturn and its known rings. (2 refs.)

74036 A CCD imager search for possible material orbiting Saturn between 10 and 36 Saturnian radii. R.L.Baron (Dept. of Earth & Planetary Sci., MIT, Cambridge, MA, USA), J.L.Elliot.
Astron. J. (USA), vol.88, no.4, p.562-4 (April 1983).
Optical imaging of the area west of Saturn from 10 to 36 Saturnian radii was used to search for possible orbiting material to a limit of $I=+22$ arcsec^{-2} for material distributed over a region larger than the seeing disk of ≈3 arcsec. For sources smaller than the seeing disk, a limit of $I=+19.5$ was reached. (6 refs.)

96.30T Other planets

74037 On the global distribution of Pluto's atmosphere. L.Trafton (Astron. Dept., Univ. of Texas, Austin, TX, USA), S.A.Stern.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.872-81 (15 April 1983).
Pluto's volatile atmosphere currently extends essentially uniformly around the globe and has nearly uniform thickness, discounting topographic elevation differences and tidal effects. Although in equilibrium with the surface ice, the atmosphere does not noticeably freeze out on the night side, during eclipses of the Sun by Charon, or at the poles during Pluto's present season near perihelion. The rotational and tidal deformations of the atmosphere affect the atmospheric thickness by 0.6-2% for a pure CH_4 atmosphere, depending on the unknown mass of Charon, and up to 15% for an atmosphere with high mean molecular weight. An important consequence of the global uniformity of Pluto's atmosphere and the observed CH_4 column abundance of 27 ± 7

m−Am is that Pluto's surface is close to 58K over the entire globe. This compares with the value ~43K expected on the basis of insolation and black-body radiation. The authors discuss the explanation for Pluto's elevated surface temperature. (21 refs.)

96.50 OTHER OBJECTS IN THE PLANETARY SYSTEM

96.50G Comets

74038 Charge exchange in solar wind-cometary interactions. T.I.Gombosi, M.Horanyi, K.Kecskemety (Central Res. Inst. for Phys., Hungarian Acad. of Sci., Budapest, Hungary), T.E.Cravens, A.F.Nagy.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.889-98 (15 May 1983).
The effects of charge exchange between fast solar wind ions and slow cometary neutrals at the contact discontinuity separating the ionosphere of a comet from the solar wind flow are examined. The continuity equations were solved analytically for a water-dominated cometary ionosphere, including both ionization and recombination processes. It was found that this new solution differs significantly from the one obtained by neglecting recombination. The normalized neutral and ion densities in the atmospheres of active comets were shown, using an appropriate dimensionless variable to exhibit an interesting scaling behavior. Solar wind ions have a significant probability of participating in a charge exchange interaction with a cometary neutral molecule, because the cometary neutral particle density beyond the contact discontinuity is not negligible. Charge exchange can effectively increase the distance of the contact discontinuity from the nucleus by removing a significant portion of the momentum from the solar wind flow. For instance, it is shown that for realistic Comet Halley parameters charge exchange can possibly increase the standoff distance from a couple of hundred to a few thousand kilometers. (18 refs.)

74039 An upper limit to the microwave continuum radiation from Comet Austin (1982g). L.E.Snyder (Dept. of Astron., Univ. of Illinois, Urbana, IL, USA), P.Palmer, C.M.Wade.
Astrophys. J. Lett. Ed. (USA), vol.269, no.1, pt.2, p.L21-3 (1 June 1983).
A sensitive search for continuum radiation at 6.1 cm wavelength from Comet Austin (1982g) was made with the VLA at the time of its closest approach, in 1982 August. No signal was detected; the best upper limit for the daily continuum flux density is 1.4×10^{-4} Jy. This is nearly an order of magnitude less than the flux density predicted on the basis of the icy grain halo model. (9 refs.)

74040 New Comet Sugano-Saigusa-Fujikawa 1983e. S.W.Milbourn.
Br. Astron. Assoc. Circ. (GB), no.635, 1 pp. (18 May 1983).
It is reported that a 7th-magnitude comet was discovered in Andromeda on 1983 May 8. Preliminary parabolic orbital elements are given, together with an ephemeris for the period 1983 May 16 to June 5 at five-day intervals, for the period 1983 June 5 to 20 at one-day intervals, and for the period 1983 June 20 to 30 at five-day intervals. The comet is expected to be at a minimum distance of 0.063 AU from the Earth on 1983 June 13, when it will be at magnitude 4.0. (no refs.)

74041 Comet IRAS-Araki-Alcock 1983d. S.W.Milbourn.
Br. Astron. Assoc. Circ. (GB), no.635, 1 pp. (18 May 1983).
Improved parabolic orbital elements are presented, together with an ephemeris for the period 1983 May 21 to June 30, at five-day intervals. (no refs.)

74042 Attitude perturbations of the Giotto spacecraft in the dust cloud of comet Halley. G.M.Coupe, R.M.Dean (Spacecraft Technol., Dept., ESA Tech. Directorate, Noordwijk, Netherlands), R.Laine.
ESA J. (Netherlands), vol.7, no.1, p.15-24 (1983).
ESA's interplanetary spacecraft Giotto will fly-by comet Halley in March 1986 on a trajectory that will bring the spacecraft within a few hundred kilometres of the comet nucleus. It is intended that it should pass through the scientifically interesting, relatively dense part of the dust cloud surrounding the nucleus, which will inevitably disturb the spacecraft's attitude. It will be spinning at a nominal 15 rpm and is equipped with a two-element dust protection shield to protect its vital equipment from damage due to dust-particle impacts occurring at a relative velocity of about 69 km/s. Taking into account the latest updates of the comet dust and gas environment model, this paper presents a mathematical evaluation of the statistical properties of the spacecraft attitude perturbations to be expected during Giotto's entry into and traversal through the comet dust cloud. (7 refs.)

74043 Comet IRAS-Araki-Alcock (1983d). J.Davies, J.Gibson, C.S.Morris, J.-C.Merlin, J.Bortle, D.Green, E.Everhart, E.Schwart, G.Schwartz, D.P.Cruikshank, R.Brown, M.Geffert.
I.A.U. Circ. (USA), no.3798, 1 pp. (6 May 1983).
It is reported that Comet IRAS-Araki-Alcock was detected on 1983 April 26 by the IRAS Preliminary Analysis Facility. Exposures on 1983 May 2 show the trailed images of the comet to have a strongly condensed nucleus and a weak asymmetric coma, denser on the northeastern side; there was no evidence of a tail. Visual magnitude estimates and coma diameters are reported for the period 1983 May 4 to 6; 14 precise positions covering the same period are also reported. (1 ref.)

74044 Comet IRAS-Araki-Alcock (1983d). V.Smith, B.G.Marsden.
I.A.U. Circ. (USA), no.3799, 1 pp. (6 May 1983).
It is reported that visual observations of the comet on 1983 May 5 showed no real structure but a stellar nucleus. Digicon-scanner spectra showed the nucleus to be dominated by reflected sunlight; some faint C emission at 516 nm was detected from a very faint extension 5″ to the northeast. Improved parabolic orbital elements are presented, together with an ephemeris; this ephemeris covers the period 1983 May 8.0 to 10.0 at 0.5-day intervals, and the period 1983 May 10.0 to 11.6 at 0.1-day intervals. (no refs.)

74045 Comet IRAS-Araki-Alcock (1983d). B.G.Marsden.
I.A.U. Circ. (USA), no.3800, 1 pp. (6 May 1983).
Presents a continuation to the ephemeris on IAUC 3799. This ephemeris covers the period 1983 May 11.6 to 13.5 at 0.1-day intervals; the period 1983 May 13.5 to 16.0 at 0.5-day intervals; the period 1983 May 16.0 to 21.0 at one-day intervals; and the period 1983 May 21.0 to June 15.0 at five-day intervals. (1 ref.)

74046 Comet IRAS-Araki-Alcock (1983d). K.Ishida, E.Everhart, R.Weymann, G.Schwartz, C.Kowal, M.Geffert, B.Milet, G.Bothum, J.Drummond.
I.A.U. Circ. (USA), no.3801, 1 pp. (9 May 1983).
The authors report 22 precise positions covering the period 1983 May 2 to 9. In addition the following predicted radiant is given for any meteor shower that may be associated with the comet: maximum on 1983 May 10.1 UT, $\alpha=289°$, $\delta=+44°$. (1 ref.)

74047 Comet IRAS-Araki-Alcock (1983d). B.G.Marsden, M.A'Hearn, R.Millis, M.Festou, P.Benvenuti, C.Cacciari, A.Cassatella, A.Talavera, W.Wamsteker, D.W.E.Green, A.Hale.
I.A.U. Circ. (USA), no.3802, 1 pp. (9 May 1983).
Improved parabolic orbital elements are reported for Comet IRAS-Araki-Alcock. It is reported that a crude reduction of observations on 1983 May 7 yield an OH production rate of 9×10^{27}/sec and a CN production rate of 5×10^{25}/sec. IUE observations of the comet on 1983 May 6 and 8 are also reported. Low resolution spectra (120 to 320 nm) showed emission features due to Lα, S, CS, the CO_2^+ doublet and OH; the continuum was very weak. The CS emission was very strong; the exceptional CS brightness observed within the IUE slit is due to the small geocentric distance and the sharply peaked CS density distribution. From the appearance of the spectrum of the comet in comparison with earlier IUE observations it seems that the comet is not new in the Oort sense. Finally, total naked-eye magnitude estimates and coma diameters are reported for the period 1983 May 7 to 9. (2 refs.)

74048 Comet Sugano-Saigusa-Fujikawa (1983e). Y.Kozai, B.Mayer.
I.A.U. Circ. (USA), no.3803, 1 pp. (9 May 1983).
It is reported that a 7th-magnitude comet has been discovered in Andromeda. Four approximate positions are given for the period 1983 May 8 to 9. (no refs.)

74049 Comet IRAS-Araki-Alcock (1983d). T.Kumanori, G.Douglass, B.Milet, P.Stattmayer, B.Manning, B.A.Skiff, J.Fabricius, R.McNaught, A.C.Gilmore, P.M.Kilmartin.
I.A.U. Circ. (USA), no.3808, 1 pp. (13 May 1983).
Reports a semi-accurate position for the epoch 1983 April 20, and 22 precise positions for the period 1983 May 6 to 12. The April 20 position was obtained from a prediscovery observation. (1 ref.)

74050 Comet IRAS-Araki-Alcock (1983d). D.P.Cruikshank, R.H.Brown, D.Griep, P.D.Feldman, M.F.A'Hearn.
I.A.U. Circ. (USA), no.3809, 1 pp. (13 May 1983).
The authors report infrared observations of Comet IRAS-Araki-Alcock for the period 1983 May 6 to 8, and IUE observations during the period May 11 to 13. Infrared photometric data in nine filter bands from L through Q (3.3 to 20 μm) fit a blackbody curve for about 300K, with no evidence of a silicate emission feature. In addition spectrophotometric scans of the nuclear condensation from 0.8 to 2.6 μm showed no emission features at 5% resolution, but the thermal component of the energy distribution was apparent longward of about 2.4 μm. Spatial scans at 11.6 and 20 μm give a halfpower width of 6″ for the nuclear condensation. The authors also report the discovery from IUE observations of a series of emission bands (attributed to S_2) between 280 and 310 nm; this emission is confined to a region with a diameter no larger than 100 km (5″) around the nucleus of the comet.

74051 Comet Sugano-Saigusa-Fujikawa (1983e). M.Sugano, B.A.Skiff, K.Ishida, T.Seki, R.E.McCrosky, D.W.E.Green, E.Everhart, T.Urata, B.G.Marsden.
I.A.U. Circ. (USA), no.3810, 1 pp. (13 May 1983).
An approximate position is reported for the epoch 1983 May 8, together with six precise positions for 1983 May 10 and 12. Two sets of parabolic orbital elements are presented, with an ephemeris for the period 1983 May 6 to June 5, at five-day intervals. It is predicted that the comet will pass 0.06 AU from the Earth on 1983 June 12, and will then be at 4th or 5th magnitude. (no refs.)

74052 Comet IRAS-Araki-Alcock (1983d). S.M.Larson, D.Campbell, P.Ford, A.Forni, J.Harmon, A.Hine, B.G.Marsden, I.I.Shapiro, P.M.Millman, A.F.Cook, S.Clifton, J.E.Bortle, C.S.Morris.
I.A.U. Circ. (USA), no.3811, 1 pp. (18 May 1983).
It is reported that direct visual inspection at up to 1000x of the comet's nuclear condensation on 1983 May 11 showed a 0.5″±0.1″ disc that, unlike nearby stellar images, appeared to have a sharp edge and uniform brightness. This 12-km feature was presumably not the nucleus since there was no indication of phase. The nuclear condensation was estimated to be of mag. 10.5, implying an albedo of 0.0085. Direct images of the inner coma on May 11 show a sunward-directed fan indicative of a slowly rotating nucleus. Spectra in the range 300 to 560 nm obtained on May 6, 7 and 11 show emission lines of OH, NH, CN, C_2, C_3, NH_2, CO^+, CO_2^+ and probably S_2. Continuous wave radar observations at 2380 MHz on May 11 yielded good strong returns with a 4-Hz bandwidth and a suggestion of a weaker and wider 'skirt'. Preliminary analysis of meteor radio data for the period 1983 May 8 to 11, and photographic and visual monitoring on May 10, show no evidence of unusual meteor activity. Finally visual estimates of the total magnitude and coma diameter of the comet are presented for the period 1983 May 10 to 13. (5 refs.)

74053 Comet Sugano-Saigusa-Fujikawa (1983e). S.J.Bus, E.H.Bus, R.E.McCrosky, D.W.E.Green, B.G.Marsden.
I.A.U. Circ. (USA), no.3812, 1 pp. (18 May 1983).
Four precise positions are reported for the period 1983 May 11 to 18. A visual observation on 1983 May 18 yielded a visual magnitude of $m_1=7.7$ and a tail length of about 15′. Improved parabolic orbital elements are given, together with an ephemeris for the period 1983 May 21 to June 5 at five-day intervals, and for the period 1983 June 5 to 19 at one-day intervals; the comet will approach to within 0.063 AU of the Earth on June 13. (no refs.)

96.50K Meteors, showers and meteoroids

74054 Range distribution of sporadic meteors and sunrise. G.Cevolani (Lab. FISBAT, Nat. Res. Council, Bologna, Italy), V.Porubcan.
Nuovo Cimento C (Italy), vol.5C, ser.1, no.5, p.561-70 (Sept.-Oct. 1982). [received: May 1983]
The echo ranges of 6921 sporadic meteors, determined by the Budrio meteor radar in April-September 1978 during a 15 hour interval around sunrise, are analysed. The variation of the mean ranges exhibits no correlation with the geomagnetic K_p index. The observed seasonal variation of the mean ranges at three times of the day is accounted for by the position of the Earth's apex. The mean ranges with respect to local sunrise in the meteor region show a variation with a minimum just after sunrise. (11 refs.)

74055 Distribution of particle sizes which are formed in the process of modeling the ablation of meteoric material. V.N.Zelenin, I.E.Konstantinov, S.G.Mikheenko, O.N.Salimov (Inst. of Engng. Phys., Moscow, USSR).
Sol. Syst. Res. (USA), vol.16, no.3, p.140-7 (July-Sept. 1982). Translation of: *Astron. Vestn. (USSR)*, vol.16, no.3, p.174-81 (July-Sept. 1982). [received: April 1983]
Performs experiments to model the destruction of a meteoric body as it moves through the atmosphere. In the experiments, the authors determine the size spectra of particles which are formed in processes such as evaporation-

condensation, atomization of liquid melt, and destruction as a result of the thermal stresses which are set up in the conditions of modeling. The samples used for model meteors were made of iron, basalt, and ceramic. The size distribution of the particles which are formed in the fragmentation process can be approximated by a logarithmic-normal distribution law with parameters which can be related to the parameters of destruction probability. In order to calculate the critical size in the case that destruction is occurring as a result of thermal stresses and atomization of liquid melt by an inflowing stream, the authors obtain theoretical formulas which agree well with the results of the experiments. (14 refs.)

96.50M Meteorites, micrometeorites

74056 The formation and the evolution process of the Jilin meteorite. Ouyang Zi-yuan (Inst. of Geochem., Acad. Sinica, Shanghai, China).
Chin. Phys. (USA), vol.3, no.1, p.69-78 (Jan.-March 1983). [received: May 1983]
Based on the data from an integrated study by a multidisciplinary group on the Jilin meteorite, the authors discuss the following aspects concerning its formation and evolution: (1) The fractionation-condensation of the solar nebula was examined based on the condensation and solidification age and the mineral composition of the Jilin meteorite. (2) The thermometamorphic history of the Jilin parent body was discussed based on the data on the loss of rare gases, the chemical composition of the whole rock, the self-purification of rare-earth elements and the composition stability of olivine and orthopyroxene. (3) The cooling process of the Jilin parent body was analyzed according to the Ni content and the width of taenite, and the retentivity of argon and fission tracks in the minerals. (4) The breakup of the Jilin parent body and its cosmic ray irradiation history; based on the measurements of the cosmogenic nuclides as He^3, $Ne^{20,21,22}$, Ar^{38}, Na^{22}, Al^{26}, Mn^{54}, Mn^{53}, Co^{60} etc., a two-stage model of the irradiation history of the Jilin meteorite was proposed. From the data on the Jilin meteorite parent body of the first stage (the age =10-11 MY and r=10 m) and that of the second stage (the age=0.3-0.5 MY and r=80-90 cm). The relative positions of samples in the parent body, their burial depths as well as the post-atmospheric loss by ignition were determined. (5) The falling process of the Jilin meteorite; the orbits of the Jilin meteor in the Solar System and in the atmosphere, and its falling process were discussed. (21 refs.)

74057 ^{39}Ar recoil losses and presolar ages in Allende inclusions. I.M.Villa, J.C.Huneke, G.J.Wasserburg (Div. of Geological & Planetary Sci., California Inst. of Technol., Pasadena, CA, USA).
Earth & Planet. Sci. Lett. (Netherlands), vol.63, no.1, p.1-12 (April 1983).
Ar analyses are reported for five coarse-grained, Ca-Al-rich inclusions from the Allende meteorite. The samples were neutron-irradiated in individual evacuated ampoules, and the Ar gas in the ampoules as well as the samples was analyzed. A large fraction (up to 60%) of the ^{39}Ar from ^{39}K (n, p) reactions was lost out of the inclusions into the ampoules. The ^{39}Ar losses resulted in substantial increases in the apparent ^{40}Ar-^{39}Ar ages of the samples. ^{39}Ar recoil loss during neutron-irradiation is a major effect and must be accounted for in ^{40}Ar-^{39}Ar dating. All of the Allende inclusions studied contained substantial trapped ^{36}Ar. The origin of the trapped ^{36}Ar is unknown, and the possible presence of trapped ^{40}Ar cannot be excluded. Ar measurements on Allende inclusions which have yielded anomalously old ages must be re-examined in the context of ^{39}Ar recoil loss and possible contributions of trapped ^{40}Ar. Allende inclusions appear on both accounts to be poor candidates to search for relicts of presolar materials with well-defined K/Ar ages. (26 refs.)

Barium from a mini *r*-process in supernovae ....See Entry 74091

96.60 SOLAR PHYSICS

74058 Microwave and hard X-ray imaging of a solar flare on 1980 November 5. P.Hoyng (Space Res. Lab., Astron. Inst., Utrecht, Netherlands), K.A.Marsh, H.Zirin, B.R.Dennis.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.865-79 (15 May 1983).
An analysis is given of the flare of 1980 November 5 at 22:26 UT on the basis of radio imaging data from the Very Large Array (VLA) at 15 GHz, X-ray imaging data from the hard X-ray imaging spectrometer (HXIS) in the range 3.5-30 keV, radio and X-ray spectral data, and optical data. The flare produced two impulsive hard X-ray spikes detectable up to 300 keV. VLA images showed compact sources ($\sim 3''$) with brightness temperatures up to 10^9K located over the neutral line. The polarization is opposite on either side of the neutral line, reaching values of 50%-80%. HXIS observed small excess photon fluxes above 16 keV on either side of the VLA microwave source. The microwave and X-ray data imply a magnetic field of about 550 gauss and a bending of the field lines over $\geq 80°$ over a distance of $3''$. Optical, microwave, and X-ray data exclude a common origin of microwaves and hard X-rays from a purely thermal plasma, but they are not inconsistent with a thick-target model: freely streaming fast electrons with energies between 15 keV and >100 keV precipitating along a single magnetic loop with a temperature of $(2.5\text{-}3) \times 10^7$K. (16 refs.)

74059 The role of spicules in heating the solar atmosphere: implications of EUV observations. G.L.Withbroe (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.825-36 (15 April 1983).
Measurements of the spatial and temporal variations of EUV emission from spectral lines formed at temperatures between 2×10^4 and 2×10^6K are used to demonstrate that EUV emitting inhomogeneities, which are associated with spicules disappear at heights ~15000 km above the limb the same height at which Hα spicules disappear. The mean scale height of EUV spicules observed in several quiet regions and a polar coronal hole is 2000 km±300 km, in good agreement with the scale height of Hα spicules. An upper limit is determined for the mass of cool ($T < 5 \times 10^5$K) material at heights $h > 17000$ km. The EUV observations suggest that release of gravitational potential energy of downward flowing cool material from spicules is not the primary source of global heating for the upper chromosphere, although it does make a nonnegligible contribution. If spicular material plays an important role in the global chromospheric-coronal energy balance, it most likely does so by being heated to coronal temperatures at low heights ($h \lesssim 15000$ km). (20 refs.)

74060 Solar type II radio emission and the shock drift acceleration of electrons. G.D.Holman (Astron. Program, Univ. of Maryland, College Park, MD, USA), M.E.Pesses.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.837-43 (15 April 1983).
Many of the properties of energetic electrons and ions accelerated by interplanetary shock waves can be understood in terms of the shock drift acceleration mechanism. The authors show that the shock drift acceleration of electrons can be responsible for solar type II radio bursts as well and review the shock drift acceleration mechanism and show that the streaming distribution of reflected electrons produced upstream of the shock front by this mechanism can be unstable to the generation of electrostatic plasma waves, which in turn interact to produce the observed radio emission. The authors derive constraints upon the density and energy of suprathermal electrons required to produce a typical type II burst. (32 refs.)

74061 Temporal variations of nucleonic abundances in solar flare energetic particle events. I. Well-connected events. G.M.Mason, G.Gloeckler (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA), D.Hovestadt.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.844-62 (15 April 1983).
Surveys the temporal variations of the relative abundances of 0.6-2.4 MeV per nucleon ions accelerated in solar particle events whose parent flares were located in the so-called well-connected region between W20° and W80° solar longitude. The survey was carried out under solar minimum conditions from 1973 November to 1977 December. Several particle events were found which originated in the well-connected region and, of these, two events appeared remarkably free of contamination from other solar particle events or interplanetary disturbances. During the rise phase, the abundances measured at 1 AU were characterized by large decreases in the Fe/O ratios, of the type reported by others, as well as significant decreases in the O/He ratio. It is concluded that the rise phase variations may be understood in terms of interplanetary propagation effects. A detailed comparison of model calculations with the rise phase observations is discussed. (60 refs.)

74062 A thermal model of sunspot influence on solar luminosity. P.Foukal, L.A.Fowler, M.Livshits (Atmospheric & Environmental Res. Inc., Cambridge, MA, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.863-71 (15 April 1983).
Recent measurements of the solar irradiance have confirmed that sunspots block energy flow to the photosphere in rough proportion to their area and photometric contrast. The authors construct a time-dependent two-dimensional model of heat flow blocking in a turbulent convective layer to investigate the physical interpretation of the observed irradiance dips. The numerical model shows how formation of a spot at or below the photosphere leads to heating of surrounding convective layers over a diffusive time scale $\tau_D \sim 10^4$ s. This heating rapidly propagates outward, storing the blocked heat throughout the convection zone. The stored thermal (and potential) energy is only released very slowly by radiation through a gradually increasing photospheric temperature. The authors point out that this very efficent storage implies a sunspot contribution to the modulation of $L_\odot$ over the 11 year cycle, at a level somewhat below 0.1%. (43 refs.)

74063 A solar breeder to explain constant luminosity and the lack of neutrinos. C.Alexander, A.M.Perry (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), L.H.Levine, L.M.Libby.
AIP Conf. Proc. (USA), no.96, p.273-6 (1982). (Workshop on Science Underground, Los Alamos, CA, USA, 1982).
A breeder supplying energy in the Sun runs for billions of years. Instead of solar neutrinos, it produces antineutrinos from fission products and actinide decays. It gives the Sun constant luminosity as required by archaean biology. This follows because reactors are negatively thermostatted. (4 refs.)

74064 Spectral line parameters for the pure rotation bands of solar OH. A.Goldman, J.R.Gillis (Dept. of Phys., Univ. of Denver, Denver, CO, USA), J.A.Coxon.
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.29, no.5, p.469-70 (May 1983).
Spectral line parameters for the $\Delta\nu = 0$ rotation transitions of OH observable in the solar photosphere are generated. The line parameters, which include line positions, ground state energies and intensities, are calculated at 6000K for the $X^2\Pi(0\text{-}0)$, (1-1), (2-2), and (3-3) bands. (8 refs.)

74065 Multiscale model equations for turbulent convection and convective overshoot. P.S.Marcus (Dept. of Math., MIT, Cambridge, MA, USA), W.H.Press, S.A.Teukolsky.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.795-821 (15 April 1983).
The Navier-Stokes equations for a compressible fluid with radiative diffusivity and viscosity are analyzed in the inelastic limit (Mach number ≪1), using window-function localized Fourier transforms. This technique allows the spectral dynamics of a turbulent eddy cascade to be studied in wavenumber space, while also modeling the spatial variation of the velocities and other mean quantities such as temperature, density, and opacity. Physical arguments which give the expected relative phase of various quantities are used instead of (e.g.) closure assumptions about higher moments. A set of time-dependent equations is obtained. 97.20 NORMAL STARS (BY CLASS): GENERAL OR INDIVIDUAL

74066 The environment of T Tauri stars. R.A.Chevalier (Dept. of Astron., Univ. of Virginia, Charlottesville, VA, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.753-65 (15 May 1983).
The environments of T Tauri stars are probably determined by the interaction of a stellar wind with matter which is falling toward a newly formed star. As shown by Ulrich (1976), the steady infall of cool gas with angular momentum toward the star leads to a density distribution with $\rho \propto r^{-1/2}$ inside a radius r_d and $\rho \propto r^{-3/2}$ outside r_d. The radius r_d is determined by the angular momentum of the infalling gas. The expansion of the wind into this medium depends on the parameter $\alpha = \dot{M}_w \nu_w / \dot{M}_{in} \nu_{in}(r_d)$, where $\nu_{in}(r_d)$ is the free-fall velocity at r_d, $\dot{M}_{in}$ is the mass accretion rate ν_w is the wind velocity, and $\dot{M}_w$ is the mass loss rate. For $\alpha < 1$, the wind is trapped within r_d, and for $\alpha > 1$, the wind can expand into the cloud. It is likely that the cloud gas is clumpy and that clumps are present in the wind region. If the clumps have sufficiently high surface densities, they fall toward the star. The interaction of the wind with the clumps can ionize the wind gas. This model is applied to T Tauri. The shocked wind gives the radio emission and nebular emission, and dust within the clumps gives the infrared emission. T Tauri is in a transitory phase in which most of the wind has only recently propagated beyond r_d. (37 refs.)

74067 HH 1 and HH 2: the results of an eruptive event in the Cohen-Schwartz star?. R.Mundt (Steward Obs., Univ. of Arizona, Tucson, AZ, USA), L.Hartmann.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.766-77 (15 May 1983).
Spectroscopic observations of the Cohen-Schwartz star (C-S star) have been carried out at medium (Δλ=2 and 3 Å) and at high spectral resolution (Δλ=0.3 Å) using the Arizona/Smithsonian Multiple Mirror Telescope. This T Tauri star is probably the exciting source of HH 1 and HH 2. The C-S star shows typical characteristics of a weak T Tauri activity, with $W_\lambda(H\alpha) \approx 10$ Å. No blueshifted absorption feature is detectable in the high-resolution Hα line profile (signal-to-noise ratio ≈5). The observations presented here, combined with former photometric and spectroscopic studies of the C-S star, indicate that this object has not been very active for the past 30 years. The relatively weak and narrow Hα emission observed gives no indication that continuous mass loss is occurring on the scale required by several models for the excitation of HH 1 and HH 2, with discrepancies of several orders of magnitude. It is possible that FU Orionis type outbursts (or other long-term variations of the exciting source) can resolve the discrepancy. However, it is concluded that none of the presently proposed models for the powering of the shock emission from Herbig-Haro objects provide very satisfactory interpretations of the observational data. (66 refs.)

74068 The *r*- and *s*-process nuclei in the early history of the Galaxy: HD 122563. C.Sneden, M.Parthasarathy (Dept. of Astron., Univ. of Texas, Austin, TX, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.757-78 (15 April 1983).
Spectra in the blue and ultraviolet spectral regions have been obtained for the extremely metal-poor giant star HD 122563. A complete model atmosphere, spectrum synthesis analysis of this star is performed, employing a large number of weak iron-peak species lines and laboratory oscillator strengths. Spectral features of many rare earth elements is detected in the ultraviolet. The large overdeficiency of nearly a factor of 10 for the *s*-process element barium is confirmed and is shown to extend to the other *s*-process elements La, Ce, Pr, Nd, and Sm. The *r*-process elements Eu, Gd, Dy, and possibly Er and Yb are less deficient than the *s*-process elements but do exhibit lower ratios with respect to iron-peak elements than in the Sun. A supplementary differential analysis of HD 122563 with respect to the Sun shows that the heavy-element abundances are not very model-atmosphere dependent. The heavy-element abundances can be understood with nucleosynthesis models in which the progenitors of this star produce mainly *r*-process isotopes. A small contribution of the *s*-process to the creation of the elements Sr, Y, Zr, and possibly Ba is not ruled out, but such traditional *s*-process elements as La, Pr, and Nd appear to have been made in the *r*-process in stellar generations prior to the formation of HD 122563. (101 refs.)

74069 A search for weak Hα emission line pre-main-sequence stars. E.D.Feigelson, G.A.Kriss (Dept. of Phys., MIT, Cambridge, MA, USA).
Astron. J. (USA), vol.88, no.3, p.431-8 (March 1983).
Reports a spectroscopic survey of 177 stars brighter than about 12.5 in R near four dark clouds in an effort to find pre-main sequence (PMS) stars with weak Hα emission. A number of such stars have been found previously in X-ray images of star formation clouds. Six new candidate PMS stars with EW (Hα) between 0.4 and 4.2 Å, in addition to four X-ray discovered stars, are found in the L1551 and L1529 clouds in the Taurus-Auriga complex. The total number of pre-main-sequences stars in these clouds appears to be about two times the number of strong emission line T Tauri stars. (31 refs.)

97.30 VARIABLE AND PECULIAR STARS

(inc. novae)

74070 Nova shells. J.G.Cohen, A.J.Rosenthal (Palomar Obs., California Inst. of Technol., Pasadena, CA, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.689-97 (15 May 1983).
A search to find spatially resolved nova shells was carried out; two new shells (around FH Ser 1970 and V533 Her 1963) were discovered. The angular sizes measured at the current epoch of the eight previously known shells around novae which erupted prior to 1945 imply that the shells are coasting out at constant velocity. Expansion velocities, interstellar absorptions, and masses of the ejected material were determined for several recent novae. A new calibration of the maximum visual luminosity-rate of decline relationship for galactic novae is given. (32 refs.)

74071 Orbital periods of novae before eruption. B.E.Schaefer (MIT, Center for Space Res., Cambridge, MA, USA), J.Patterson.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.710-17 (15 May 1983).
Uses the collection of archival plates at Harvard College Observatory to search for the eclipse periods of two novae (BT Mon and DQ Her) both before and after the outburst. The eclipse period of BT Mon is manifest in the data both before and after its 1939 eruption. The pre-eruption eclipse period is 0.3338010 d, which is 40 parts per million shorter than the modern period. With reasonable assumptions concerning the angular momentum carried off by the ejected material, this provides a dynamical measure of the mass of the ejecta, which is estimated to be 3×10^{-5} $M_{\odot}$. The specific angular momentum of the shell around BT Mon cannot be greatly in excess of the specific orbital angular momentum of the white dwarf. Analysis of all available data fails to specify the pre-eruption eclipse period of DQ Her, presumably because the light curve is badly smeared by the long photographic exposure times. (35 refs.)

74072 Episodic mass loss and narrow lines in gamma Cassiopeiae and in other early-type stars. H.F.Henrichs, G.Hammerschlag-Hensberge (Astron. Inst., Univ. of Amsterdam, Amsterdam, Netherlands), I.D.Howarth, P.Barr.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.807-24 (15 May 1983).
High-resolution ultraviolet spectra obtained with the IUE of the B0.5 IVe star γ Cas have revealed conspicuous changes in the profiles of the resonance doublet lines of C IV, N V, and Si IV. In 18 out of the 28 available spectra, narrow absorption components (FWHM$\leq$160 km s^{-1}) of varying strengths (up to almost saturated profiles) are found at the blueshifted side of the rest wavelength. Sometimes the components are multiple. The central velocities of the narrow lines are between -650 and $+1500$ km s^{-1}. It is suggested that the occurrence of these narrow, high-velocity, high-excitation absorption lines (usually referred to as 'narrow lines') might be a common phenomenon in all early-type stars, irrespective of luminosity class or Be characteristics. The observations are in agreement with a (phenomenological) model proposed earlier for the occurrence and properties of the narrow lines. It is suggested that these lines are formed in a rapidly expanding region of the stellar wind which has a higher density than the ambient 'quiet' wind, and which has resulted from an enhanced mass flux of the star during a short time (about 1 day). The physical cause of the proposed episodic mass-loss enhancement remains unexplained. (56 refs.)

74073 The minimum period and the gap in periods of cataclysmic binaries. B.Paczynski (Theoretical Astrophys., California Inst. of Technol., Pasadena, CA, USA), R.Sienkiewicz.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.825-31 (15 May 1983).
The 81 minute cutoff to the orbital periods of hydrogen-rich cataclysmic binaries is consistent with evolution of those systems being dominated by angular momentum losses due to gravitational radiation. Unfortunately, many uncertainties, mainly poorly known atmospheric opacities below 2000K, make it practically impossible to verify the quadrupole formula for gravitational radiation by using the observed cutoff at 81 minutes. The upper boundary of the gap in orbital periods observed at about 3 hours is almost certainly due to enhanced angular momentum losses from cataclysmic binaries which have longer periods. The physical mechanism of those losses is not identified, but a possible importance of stellar winds is pointed out. The lower boundary of the gap may be explained with the oldest cataclysmic binaries, whose periods evolved past the minimum at 81 minutes and reached the value of 2 hours within about 12×10^{9} years after the binary had formed. Those binaries should have secondary components of only 0.02 solar masses, and their periods could be used to estimate ages of the oldest cataclysmic stars, and presumably the age of Galaxy. An alternative explanation for the gap requires that binaries should be detached while crossing the gap. A possible mechanism for this phenomenon is discussed. It requires the secondary components to be about 0.2 solar masses in the binaries just below the gap. (22 refs.)

74074 The dust around the carbon star IRC+10216. M.Jura (Dept. of Astron., Univ. of California, Los Angeles, CA, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.647-52 (15 April 1983).
IRC+10216 is the brightest 5 μm source in the sky outside the Solar System, and it is an extremely well studied carbon star that is losing mass rapidly. The author argues that it is possible to compare sensibly the far-infrared and ultraviolet extinctions of the circumstellar gains because the same dust that shields molecules such as HCN from photodissociation also emits the observed far infrared emission. The author finds that the dust opacity varies approximately as $\lambda^{-1.3}$ when λ varies by a factor of 10^{3}. This estimate of the infrared to ultraviolet opacities is of central importance in understanding infrared observations of grains. That is, if interstellar carbon grains in general are similar to the ones around IRC+10216, they emit efficiently in the infrared, and one expects them in general to be appreciably cooler than often but not always believed. (42 refs.)

74075 An Hα survey of southern hemisphere active chromosphere stars. B.W.Bopp (Dept., of Phys. & Astron., Univ. of Toledo, Toledo, OH, USA), J.B.Hearnshaw.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.653-4 (15 April 1983).
Obtains moderate resolution Hα spectrograms of 27 southern hemisphere F-K stars with known or suspected Ca II emission, selected from the lists of Hearnshaw (1979), Weiler and Stencel (1979), and Bidelman and MacConnell (1973). The purpose is to search for the presence of Hα emission, which would be characteristic of stars with extreme levels of chromospheric activity. Two objects were found to have Hα emission as strong as V711 Tau. Seven others had a very weak or absent Hα absorption line, either partially or completely filled by chromospheric emission. These nine stars of exception activity should be observed at a variety of resolutions and wavelengths. (10 refs.)

74076 Time-resolved spectrophotometry of the emission lines in the galactic X-ray source H 2252−035. J.T.Clarke, K.O.Mason, S.Bowyer (Space Sci. Lab., Univ. of California, Berkeley, CA, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.726-31 (15 April 1983).
Carries out time-resolved optical spectrophotometry of the galactic X-ray source H 2252−035 for the purpose of studying intensity variations in the high-excitation emission lines. At a time resolution of $\sim$2 minutes, the four brightest emission lines (Hα, Hβ, Hγ, and He II λ4684) all showed short time-scale flickering and a pronounced orbital period variation in phase with the continuum modulation. The authors also detect an orbital period variation in the Balmer decrement in which the ratio Hα:Hβ:Hγ is markedly flatter at the time of the continuum maximum. To fit these observations they propose a two-component model for the line emission region in which one component of the lines comes from the accretion disk as a whole and the other from the more highly photoionized bulge region where the accretion column from the companion star intersects the disk. (14 refs.)

74077 CNO abundances and the strengths of nova outbursts and hydrogen flashes on accreting white dwarfs. J.MacDonald (Dept. of Astron., Univ. of Illinois, Urbana, IL, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.732-46 (15 April 1983).
Simple theories of the accretion phase and expansion phase of hydrogen shell flashes on accreting white dwarfs are used to find the conditions under which classical novae occur. Particular attention is paid to the possibility that the CNO abundances in the accreted envelope are greatly enhanced relative to the Sun. It is shown that such an enhancement is necessary for fast novae yet slow novae, can still occur with large CNO enhancements. Analysis of the observed properties of nova ejecta indicates that the white dwarfs in nova systems have masses in the range 1.02-1.18 $M_{\odot}$. It is found that in some novae, the accretion rate deduced from the optical luminosity in quiescence is too high to allow accretion of sufficient envelope material to get the strong hydrogen flash needed for the nova outburst. Some possible resolutions of this problem are discussed. The authors find it unlikely that recurrent novae are thermonuclear runaways on accreting white dwarfs. (89 refs.)

74078 Classification of intrinsic variables. IX. The Cepheid domain. O.J.Eggen (Cerro Tololo Inter-American Obs., La Serena, Chile).
Astron. J. (USA), vol.88, no.3, p.361-78 (March 1983).
For pt.VIII see Astrophys. J. Suppl., vol.41, no.3, p.413-34 (1979). Intermediate band, Hβ and RI observations have been obtained throughout the cycle of variation for 135 high mass, long-period and short-period Cepheids (LPC and SPC). This material, together with the observations previously discussed for some 100 ultrashort period Cepheids (USPC), is used to delineate the Cepheid domain in the (β, [C$_1$]) and (M_{Bol},log T_e) planes. Three new, small amplitude SPC are included as well as the probable, very short-period Cepheid (VSPC) in the old disk population F0 Vir. Observations of early-type stars and the SPC DL Cas in NGC 129 are also presented. The independently derived luminosity calibrations for bright giants and supergiants previously published are found to closely reproduce the luminosities derived from the Sandage-Tammann PL relation for most variables. The majority of the LPC are apparently overabundant in metals, referred to the Sun, although some rare cases of both underabundance and overluminosity may exist. Reddening determinations for the LPC indicate a small systematic correction to previous results. The theoretical 'fundamental blue edge', computed by Iben and Tuggle with Y=0.38, closely represents the blue edge of the Cepheid domain. Photometry of 39 nonvariable bright giants and supergiants in the Bright Star Catalogue places eight of them in the Cepheid domain of the (β, [C_1]) plane. Subsequent observations have indicated light variations in three of these stars. (49 refs.)

74079 Pseudocepheids. I. R Puppis, HR 4441, HR 4511, and AI CMI. O.J.Eggen (Cerro Tololo Inter-American Obs., La Serena, Chile).
Astron. J. (USA), vol.88, no.3, p.386-403 (March, 1983).
Pseudocepheids (PC) are supergiants in the Hertzprung gap with light variations more erratic than those of Cepheids. Light variations, colour indices, reddening, cluster memberships, intrinsic indices and metal abundances are considered for R Puppis, HR 4441, HR 4511 and AI Caris Minoris. (40 refs.)

74080 HR 9070: a nonradially pulsating Be star?. J.R.Percy (David Dunlap Obs., Univ. of Toronto, Toronto, Ontario, Canada).
Astron. J. (USA), vol.88, no.3, p.427-30 (March 1983).
The bright Be star HR 9070 is photometrically variable with a range of about 0.03$^{\mathrm{m}}$ and a period of about 0.307$^{\mathrm{d}}$. The period appears to be stable to better than 1% over many years. The light curve is sinusoidal. There are no significant variations in uvby colors. Of all the possible explanations for the variability, the most likely is nonradial pulsation. (15 refs.)

74081 High-resolution Hα observations of γ Cas and π Aqr. G.Fontaine, P.Lacombe, F.Wesemael (Dept. de Phys., Univ. de Montreal, Montreal, Quebec, Canada).
Astron. J. (USA), vol.88, no.4, p.527-31 (April 1983).
High-resolution (0.28-Å) observations of the Hα emission line in the two Be stars γ Cas and π Aqr are presented. A total of 16 and 19 independent observations, respectively, were obtained for these two stars over a two-day period. In contrast to some previous reports, no changes in equivalent width, radial velocity, and line profile were detected in either star over time scales of several hours. To the authors' knowledge, these upper limits on these variations ($\gtrsim$0.5% for the line profiles; $\gtrsim$8 km s^{-1} for the radial velocity) are the most stringent available to date for these two stars. (11 refs.)

74082 Variable F-type supergiants far above the galactic plane. D.D.Sasselow (Dept. of Astron., Univ. of Sofia, Sofia, Bulgaria).
Inf. Bull. Variable Stars (Hungary), no.2314, p.1-2 (19 April 1983).
The author draws attention to a class of F-type supergiant stars, the members of which exhibit strikingly similar photometric behaviour, galactic distribution and kinematics. These stars are characterised by semi-regular light variations with Δm$\leq$0.6 mag. (usually 0.2 mag.); two or three alternating periods from about 30 to 120 days; spectral type F0-F7 Ia-Ib; $\langle B-V\rangle_0$ from +0.10 to +0.50; $|z|\geq1$ kpc; and space velocities typical of Population II stars. Photometrically these stars are outside the Cepheid instability strip, they occupy a compact isolated area on the P-C diagram, and they do not obey the semiperiod-L-C relation for 'normal' supergiants; it is suggested that they pulsate non-radially. In addition these stars seem to have normal Population I abundances and mild infrared excesses. The best studied members of the class are UU Herculis, 89 Herculis, HD 161796, BL Telescopii (F), and HD 112374. The author also draws attention to compact swarms of F-type supergiants (which may prove to be similar objects) around SA 28, SA 27 and SA 11. (11 refs.)

74083 CD−30°5135. G.Welin (Astron. Obs., Uppsala, Sweden).
Inf. Bull. Variable Stars (Hungary), no.2315, 1 pp. (19 April 1983).
The author reports photographic UBV magnitudes for the peculiar variable emission-line F-type supergiant CD−30 5135, obtained on November 9, December 9 and December 27, 1982. An unusually low value of U−B was recorded on 1982 December 9; it is possible that this anomaly was the result

of rapid light variations between the termination of the U-exposure and the beginning of the B-exposure. (1 ref.)

74084 Nova muscae 1983. F.M.Bateson (Variable Star Section, RASNZ, Tauranga, New Zealand).
Inf. Bull. Variable Stars (Hungary), no.2316, 1 pp. (20 April 1983).
The author reports that he has received two pre-discovery photographs of Nova Muscae 1983, taken on 1983 January 15 between $14^h 20^m$ and $15^h 15^m$ UT. The photographs were taken on Ektachrome 400 film, hypersensitised in 8% hydrogen at 25° for 24 hours. The extreme redness of the nova and the absence of stars with similar colour index made measurement of the magnitude of the nova difficult, but the magnitude is estimated at between 7.6 and 7.9 on both photographs. (1 ref.)

74085 Six variable stars discovered in binary systems. R.L.Walker (US Naval Obs., Flagstaff, AZ, USA).
Inf. Bull. Variable Stars (Hungary), no.2318, 3 pp. (21 April 1983).
The authors reports photoelectric UBV photometry between September 1968 and November 1979 of six variable stars belonging to visual binary systems. The data given are the ADS and BD numbers of the stars, the coordinates for 1900.0, the heliocentric Julian Day of the observation, the V-magnitude and the B-V and U-B colour indices. The stars observed were ADS 11632 B (BD+59°1915), ADS 14233 ABp (BD+11°4368), ADS 14894 AB (BD+2°4346), Kui 110 AB (BD+61°2233), ADS 15679 A (BD+44°4059), and ADS 15794 AB (BD+43°4165). (1 ref.)

74086 Observations of four variable stars in binary systems. R.L.Walker (US Naval Obs., Flagstaff, AZ, USA).
Inf. Bull. Variable Stars (Hungary), no.2319, pp.2 (21 April 1983).
The author reports photoelectric UBV photometry between September 1968 and April 1979 of four variable stars belonging to visual binary systems. The data tabulated are the ADS and BD numbers of the stars, their coordinates for 1900.0, information on the nature of the variable star, the heliocentric Julian Day of the observation, the V-magnitude, and the B-V and U-B colour indices. The stars observed were ADS 2046 A (=BD−1°0377=84 Ceti), ADS 8148 AB (=BD+11°2348=ι Leonis), ADS 11353 ABp (=BD+0° 3936=d Serpentis), and ADS 16483 A (=BD+27°4480=β Pegasi). The first two stars are δ Scuti variables, d Serpentis is an irregularly variable spectroscopic binary (G0 III+A6 V), and β Pegasi is an M-type irregular variable. (no refs.)

74087 Variable star in Orion. G.Klare, I.Appenzeller.
I.A.U. Circ. (USA), no.3809, 1 pp. (13 May 1983).
The authors report that plates taken early in the century with the 0.4-m f/5 Bruce astrograph show that this star was significantly brighter at that time on the Palomar Sky Survey. On 1901 January 16 the star was clearly visible at a measured B=17.5. On 1904 January 10 the star was close to the plate limit at an estimated B 17.5. (1 ref.)

74088 Photometry of a Si-Ap variable. J.A.R.Caldwell, A.W.J.Cousins (South African Astron. Obs., Observatory, S Africa).
Mon. Notes Astron. Soc. South Afr. (S. Africa), vol.41, no.7-10, p.85-90 (Oct. 1982). [received: April 1983]
The multiple star HR 3661 (E4.40) is variable with P=2.91 days. From the spectral type, B8V (pSi), it is thought that one component is a Si-Ap type variable. (13 refs.)

97.60 LATE STAGES OF STELLAR EVOLUTION

(inc. black holes)

74089 Effect of a single coordinate system of curvature on the properties of the boundary between *R*- and *T*-regions and the energy-momentum tensor. S.N.E.Samoilov.
Ukr. Fiz. Zh. (USSR), vol.28, no.4, p.596-602 (April 1983). In Russian.
Gravitational collapse of a spherically symmetric star is considered. There is a world *T*-region which includes trapped regions, Γ_0 and Γ_i being the inner and outer boundaries of the *T*-region. It is supposed that the outer space-time is asymptotically flat, and the *R*-region is covered by a single curvature coordinate system. It is shown that Γ_0 and Γ_i are generated by isotropic world lines. (8 refs.)

97.60B Supernovae

74090 Infrared light curves of Type I supernovae. II. Late stages. J.H.Elias, J.A.Frogel (Cerro Tololo Inter-American Obs., Le Serena, Chile).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.718-20 (15 May 1983).
For pt.I see Astrophys. J. Lett. Ed., vol.251, no.1, pt.2, p.L13-L16 (1981). Infrared light curves of three Type I supernovae obtained by Elias et al. (1981) are extended to approximately 1 year after minimum light. The light curves and colors show no evidence for the development of an infrared excess. The very red *J-H* color observed roughly 100 days after maximum becomes bluer, probably indicating decreased absorption at 1.2 μm. (10 refs.)

74091 Barium from a mini *r*-process in supernovae. D.Heymann (Dept. of Geology, Rice Univ., Houston, TX, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.747-56 (15 April 1983).
The relative yields of the A=134, 135, 136, 137, and 138 isobars are calculated with an approximate model for the mini *r*-process which is thought to occur in the O, Ne-rich shell of a massive star during explosive burning. Neutron dose Φ_n is the primary parameter of the calculations. The isotopic anomaly of Ba in the EK-1-4-1 inclusion of the Allende meteorite demands comparable yields at A=135 and A=137 (McCulloch and Wasserburg, 1978). Near-equal yields occur in the calculations for $\Phi_n \approx 1.5 \times 10^{-7}$ mole cm^{-3} s and for $\Phi_n \gtrsim 10^{-6}$ mole cm^{-3} s. For the small neutron dose, the A=137 and A=138 yields are near-equal which implies an excess of ^{138}Ba in EK-1-4-1 of only 1-2 parts in 10^4. The small neutron dose is close to that for which the isotopically anomalous *r*-Xe in carbonaceous chondrites is formed by the same process (Heymann and Dziczkaniec, 1979, 1980, 1981). For the large neutron dose, the A=138 yield is an order of magnitude larger than the A=135 and A=137 yields, which is difficult to accept. Thus, the dilemma of the alarmingly large ^{138}Ba yield from an *s*-enhanced seed, noted by Lee et al. (1978), is resolved, provided that the neutron dose of the mini *r*-process in the O, Ne-rich zone of a supernova is an order of magnitude smaller than the doses typically deduced for standard explosive carbon burning. Implications for Nd and Sm anomalies in the EK-1-4-1 inclusion are discussed. (22 refs.)

74092 Radioactive models of Type I supernovae. S.R.Schurmann (Dept. of Astron. & Astrophys., Univ. of Chicago, Chicago, IL, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.779-94 (15 April 1983).
Numerical models of Type I supernovae are presented. The models consist of 0.8 $M_\odot$ of radioactive ^{56}Ni in a constant density core which expands homologously at $\leq$10000 km s^{-1}, and an envelope of 0.6 $M_\odot$ with a steep density gradient and a maximum velocity of 20000 km s^{-1}. Calculations are performed for both compact and extended initial configurations. Observations of Type I supernovae near maximum light indicate severe ultraviolet deficiencies, and bolometric corrections appropriate for blackbodies with zero flux shortward of 4000 Å are applied to the model bolometric light curves. The resulting *B*-band light curves are in good agreement with the observed light curves of SN 1972e and SN 1981b, and with a composite light curve for 'fast' Type I events. (57 refs.)

74093 Possible supernova in NGC 4258. E.Hummel, J.M.van der Hulst, R.D.Davies, A.Pedlar, G.D.van Albada, P.Wild.
I.A.U. Circ. (USA), no.3803, 1 pp. (9 May 1983).
The authors report the discovery of a variable radio source at $\alpha=12^h 16^m 31.16^s$, $\delta=+47°36'08.3''$ (equinox 1950.0), in the northern spiral arm of NGC 4258. The source was detected in a VLA observation in January 1982 at a level of 5.5 mJy, and confirmed at a level of 3 mJy by a WSRT observation in late 1982; a VLA observation in June 1979 does not show the source to a limit of 0.25 mJy. The source is either a variable background source or a supernova; if it is a supernova it must have appeared between late 1979 and late 1981. Its strength is about 15 times that of Cassiopeia A and comparable to that of the supernovae SN 1970g in M101 and SN 1980k in NGC 6946. Inspection of the Zimmerwald supernova patrol films of the area of NGC 4258 has revealed a 17th-magnitude star on 1981 November 3. The position of this object is $\alpha=12^h 16^m 31.33^s$, $\delta=+47°36'10.0''$ (equinox 1950.0), that is 17″ east and 76″ north of the nucleus of the galaxy, in excellent agreement with the radio position reported above. (1 ref.)

74094 Supernovae. E.P.Aksenov, J.Kielkopf, R.Brashaer, A.Goldstein, R.Gabart.
I.A.U. Circ. (USA), no.3813, 1 pp. (18 May 1983).
Reports the discovery of supernovae in NGC 6217 and NGC 4051. The supernova in NGC 6217 was at m_{pg}=15.1 on 1983 May 11, and is 4″ east and 12″ south of the nucleus of the galaxy. The supernova in NGC 4051 was at m_{pg}=15.0 on May 12, and is 21″ east and 50″ south of the nucleus of the galaxy. An independent detection of the supernova in NGC 4051 on May 11 is also reported; the photographic magnitude was 13.5 and the offset from the nucleus of the galaxy was measured as 23″ east and 53″ south. (no refs.)

97.60G Pulsars

74095 Further observations of the long-period binary pulsar PSR 0820+02. R.N.Manchester, L.M.Newton, D.J.Cooke (Div. of Radiophys., CSIRO, Sydney, NSW, Australia), P.R.Backus, M.Damashek, J.H.Taylor, J.J.Condon.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.832-6 (15 May 1983).
Observations of the second known orbiting pulsar, PSR 0820+02, now span just over 4 years, an interval comparable to the orbital period. Analysis of pulse arrival time data has produced accurate values of the celestial coordinates of the system, as well as the pulsar dispersion measure, period, slowdown rate, and orbital elements. The pulsar's position was also determined interferometrically by using the VLA, with results in accord with the timing data to better than the combined errors. The possible evolution of this orbiting system is discussed. (18 refs.)

74096 The period history of the X-ray pulsar in MSH 15−52. M.C.Weisskopf, R.F.Elsner, W.Darbro, D.Leahy, S.Naranan (Space Sci. Lab., NASA Marshall Space Flight Center, Huntsville, AL, USA), P.G.Sutherland, J.E.Grindlay, F.R.Harnden,Jr., F.D.Seward.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.711-12 (15 April 1983).
Presents new and refined measurements of the pulse period of the X-ray pulsar in the supernova remnant MSH 15−52. The X-ray data were taken with the Monitor Proportional Counter onboard the HEAO 2 (Einstein) Observatory. The X-ray measurements alone lead to a refined value of the period derivative of $(1.5382 \pm 0.0024) \times 10^{-12}$ s s^{-1}, while including the results of more recent radio observations leads to a value of $(1.54029 \pm 0.00095) \times 10^{-12}$ s s^{-1}. (8 refs.)

74097 Elongated beams, interpulses and the new millisecond pulsar. R.Narayan, V.Radhakrishnan (Raman Res. Inst., Bangalore, India).
Curr. Sci. (India), vol.52, no.2, p.46-9 (20 Jan. 1983).
The prominent interpulse of the new millisecond pulsar is consistent with very short period pulsars having fan-like beams, as suggested earlier by an independent study. All the available data on interpulse statistics support this picture, and also indicate that pulsars with perpendicular rotation and magnetic axes are absent at long periods. (13 refs.)

74098 PSR 1937+214. M.J.Lebofsky, G.H.Rieke.
I.A.U. Circ. (USA), no.3809, 1 pp. (13 May 1983).
It is reported that Djorgovski's (1982) candidate star is unlikely to be the optical counterpart of the millisecond pulsar PSR 1937+214. The authors report that the star has a photometric CO index of 0.19±0.03, and that it therefore probably has CO bands in absorption at 2.3 μm. The photometric colours and the CO band strength are consistent with the identification of the star as a K-type giant star reddened by 8 magnitudes. The optical position of the star indicates a small but probably significant offset from the radio position of the pulsar. (2 refs.)

MSH 15−52: a supernova remnant containing two compact X-ray sources ....See Entry 74128

97.60J Neutron stars

74099 Nonradial *g*-mode oscillations of warm neutron stars. P.N.McDermott, H.M.Van Horn, J.F.Scholl (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.837-48 (15 May 1983).
Adiabatic $l=1$ and 2, *p*-, *f*-, and *g*-mode fluid oscillations of finite-temperature neutron star models are computed. The authors use the 'relativistic Cowling approximation', defined in this paper, in which all perturbations of the gravitational potentials are neglected. This approximation is expected to be adequate for the *g*-modes and even gives reasonable results for the periods of *p*- and *f*-modes. For example, in agreement with previous calculations, the authors find the *p*-mode periods to be approximately $\Pi_p \sim 0.5(M_*/M_\odot)^{-1/2}R_6^{3/2}$ ms, where R_6 is the neutron star radius in units of 10^6 cm. For the *g*-modes, the periods from the numerical calculations are $\gtrsim 400$ ms for a neutron star with $T_7 \approx 1.0$ and vary roughly as the inverse of T_7, where T_7 is the core temperature in units of 10^7K. The authors have also estimated the gravitational radiation damping times, τ, of the $l=2$ oscillation modes. For the *p*- and *f*-modes they find, again in rough agreement with previous calculations, $\tau \sim (10^2\text{-}10^3)\Pi$. For the fluid *g*-mode oscillations, however, gravitational radiation damping is exceedingly weak, with typical values of τ greatly exceeding the age of the Universe. (38 refs.)

74100 Neutron diffusion and heat transfer in the crusts of neutron stars. G.S.Bisnovatyi-Kogan, M.M.Romanova (Inst. of Cosmic Res., Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.56, no.2, p.243-8 (Aug. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.2, p.449-59 (Aug. 1982). [received: May 1983]
The coefficients that determine the neutron heat transfer and diffusion in the crusts of neutron stars are calculated on the basis of a solution of the Boltzmann equation with allowance for degeneracy. Exact expressions are obtained for the cases of strong and weak degeneracy together with interpolation formulas valid for all values of the degeneracy parameter. (14 refs.)

97.60L Black holes

74101 Stationary axially symmetric perturbations of the Reissner-Nordstrom black hole. II. Odd-parity perturbations generated by special sources. L.Dvorak (Faculty of Math. & Phys., Charles Univ., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.5, p.510-27 (1983).
For pt.1 see ibid., vol.33, p.327 (1983). The solution of the decoupled equations for the odd-parity electromagnetic and gravitational perturbations of the extreme Reissner-Nordstrom black hole is given outside the region of the source. The perturbations of the metric tensor and the electromagnetic field tensor have the form of multipole expansions. The coefficients of the expansions are given explicitly for several concrete sources (current loops and rotating loops of matter). The multipole expansions are then summed up numerically and magnetic fields generated by the sources are characterized graphically by lines of force constructed numerically. Some features of the perturbations of a general Reissner-Nordstrum black hole are also discussed. (11 refs.)

74102 Temperature dependent gravitational constant and black hole physics. A.K.Raychaudhuri, B.Bagchi (Dept. of Phys., Presidency Coll., Calcutta, India).
Phys. Lett. B (Netherlands), vol.124B, no.3-4, p.168-70 (28 April 1983).
Examines the thermodynamics of black holes in case of a varying gravitational constant. The authors find that the second law thermodynamics may remain valid contrary to the opinions expressed by some. (9 refs.)

97.80 BINARY AND MULTIPLE STARS

(inc. extrasolar planetary systems)

74103 X-ray properties of the Be/X-ray system 2S 0114+650=LSI+65°010. G.Koenigsberger, J.H.Swank, A.E.Szymkowiak, N.E.White (Lab. for High Energy Astrophys., NASA Goddard Space Flight Center, Greenbelt, MD, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.782-9 (15 May 1983).
Results are presented from experiments on the Einstein Observatory, HEAO 1, and OSO 8 on the temporal and spectral properties of 2S 0114+650. In a 12 hr Einstein monitor proportional counter and solid state spectrometer observation, two episodes of flaring occurred by an order of magnitude over about 1 hr. Variability on shorter time scales showed a preferred period of 14.9 minutes, but periodic pulsations were not seen in the HEAO 1 and OSO 8 data. The spectra above 1 keV were typical of accreting X-ray pulsars, a power law $E^{-\alpha}$ with $\alpha \sim 1.2$ for the number spectrum up to a cutoff at ~14 keV. There is some evidence that the spectrum is steeper when the source is quiescent at low luminosity, but no large spectral changes attended the flares. Absorption column densities were consistent with interstellar reddening of the proposed companion, the Be star LSI+65°010. In the minute and hour variability and in the spectral character, 2S0114+650 is similar to other Be star-neutron star binary X-ray sources. Variations over several days in the OSO 8 data suggest orbital effects. (40 refs.)

74104 Orbital period changes in Centaurus X-3. R.L.Kelley, S.Rappaport, G.W.Clark, L.D.Petro (Dept. of Phys., MIT, Cambridge, MA, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.790-9 (15 May 1983).
The authors present two new times of mid-X ray eclipse for Cen X-3 based on pulse arrival time analyses of pointed observations with SAS 3. These results, when combined with all other published eclipse times based on Doppler delay measurements, show that the 2.1^d binary period is decreasing at an average rate of $\dot{P}_{orb}/P_{orb} = -1.8 \times 10^{-6}$ yr^{-1}, but with apparently significant fluctuations about a smooth, linear decrease. The observed changes in the orbital period can be accounted for by mass loss from the systems through the L_2 point, although the required rates are implausibly high. It is also shown that the long-term overall orbital decay can be readily interpreted as the result of torques exerted by the tidally distorted companion star (Krzeminski's star) on the orbiting neutron star. The inferred asynchronism between the orbital frequency and the rotation frequency of the companion star may be maintained by mass and angular momentum loss in a stellar wind, or by a tidal instability related to the Darwin effect. However, this scenario would not provide a natural explanation for any short-term deviations from a constant rate of orbital decay. The implications of an inferred shrinking critical potential lobe around Krzeminski's star are discussed. (62 refs.)

74105 Chromospheric emission of W Ursae Majoris-type stars and its relation to the structure of their common envelopes. J.A.Eaton (Dept. of Phys. & Astron., Vanderbilt Univ., Nashville, TN, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.800-6 (15 May 1983).
The author has analyzed short-wavelength IUE spectra of 14 W UMa binary systems. All but the A2 V system GK Cep and possibly the A8 system AG Vir show chromospheric and transition-region emission lines. This property extends to at least as early as A8-9. The luminosity in transition-region emission lines is roughly proportional to bolometric luminosity. The strength of transition-region emission relative to chromospheric emission is roughly independent of spectral type and is at least as great as for other stars with enhanced surface activity. The enhanced chromospheric activity and light curve peculiarities of the hotter systems seem to disagree with the predictions of the contact-discontinuity models for contact binary structure. (42 refs.)

74106 Detection of flare like events and their relationship to presumed spot regions on V471 Tau: a solar-stellar connection. A.Young (High Altitude Obs., Nat. Center for Atmospheric Res., Boulder, CO, USA), A.Klimke, J.L.Africano, R.Quigley, R.R.Radick, D.van Buren.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.655-64 (15 April 1983).
High speed photometric observations of the eclipsing binary V471 Tau were made with the intent of detecting flares similar to those which have been reported in the literature by various observers over several years. Two such flare events were observed at a 3 σ detection level. A search of the literature uncovered five other reliably reported events. A study of the occurrence times of these events in terms of the ephemeris of the photometric wave that is known to migrate through the light curve of V471 Tau reveals a strong correlation, suggesting that the flares occur near regions of the K dwarf where spot groups are inferred. The evidence suggests that active regions similar to those observed on the Sun occur on V471 Tau but with considerably greater magnitude. A new periodic study strongly implies that the system is subject to abrupt period changes interspersing long intervals of period constancy. A new linear ephemeris is derived. New X-ray observations of the coronal radiation from the dwarf K star are also reported and discussed. (35 refs.)

74107 First observations of stellar coronal structure: the coronae of AR Lacertae. F.M.Walter (Joint Inst. for Lab. Astrophys., Univ. of Colorado, Boulder, CO, USA), D.M.Gibson, G.S.Basri.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.665-81 (15 April 1983).
Makes Einstein IPC observations of the X-ray eclipses of the RS CVn binary AR Lacertae. These data, together with contemporal IUE and radio observations, for the first time allow reasonable estimates of the structures of coronae of other solar-like stars. The X-ray luminosities of the G2 IV-V and the K0 IV components. Both components appear to have coronae with scale heights small compared to the stellar radius. Both the coronal and chromospheric surface fluxes appear to be inhomogeneous across the surfaces of the stars. (44 refs.)

74108 HR 7578: a K dwarf double-lined spectroscopy binary with peculiar abundances. F.C.Fekel,Jr. (Lab. for Astron. & Solar Phys., NASA Goddard Space Flight Center, Greenbelt, MD, USA), W.I.Beavers.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.682-90 (15 April 1983).
HR 7578 is a double-lined K2-3 V binary with a period of 46.8 days, an eccentricity of 0.69, and minimum masses for the components of 0.85 ± 0.03 $M_\odot$. Taylor (1970) classified the object as super-metal-rich and noted its unusually strong CN and sodium lines DDO photometry confirms the extremely strong CN. The age of the system is estimated. Like several recently discovered Hyades binaries, the minimum masses of the components of HR 7578 are larger than the typical values previously assumed for the spectral type. HR 7578 lies 0.5 mag below the field star mass-luminosity relation, a position similar to that of those Hyades spectroscopic binaries with the large minimum masses. (52 refs.)

74109 X-ray burst observations of Serpens X-1. M.Sztajno, E.M.Basinska, L.R.Cominsky, F.J.Marshall, W.H.G.Lewin (Dept. of Phys., MIT, Cambridge, MA, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.713-25 (15 April 1983).
Fifty-seven X-ray bursts observed with SAS 3 in the period 1976 July to 1979 March are reported. Their general features and the relations between them are discussed. Also a comparison is made between these burst features and the associated persistent X-ray flux. The latter appears to be correlated with the maximum burst flux; the temperature of the plasma that produces the persistent flux is roughly proportional to this flux. (62 refs.)

74110 The short-period eclipsing system XY UMa: 1982 *UBV* light curves and a flare-like event. M.Zeilik, R.Elston, G.Henson (Dept. of Phys. & Astron., Univ. of New Mexico, Albuquerque, NM, USA).
Astron. J. (USA), vol.88, no.4, p.532-4 (April 1983).
The authors observed the short-period eclipsing system XY UMa (which displays RS CVn phenomena) on two nights in early 1982 at *UBV* bands. The light curves show both primary and secondary eclipses are asymmetrical and that a distortion wave of small amplitude has a minimum near phase 0.25. On the night of 1/31/82, the authors recorded a flare-like episode at phase 0.57 whose duration was about 30 minutes. The total energy in the outburst was about 9% of the system's flux at *U*, 4% at *B*, and 3% at *V*. (23 refs.)

74111 A *UBV* photoelectric investigation of the eclipsing binary system DM Virginis. R.L.Walker (US Naval Obs., Flagstaff Station, Flagstaff, AZ, USA), C.R.Chambliss.
Astron. J. (USA), vol.88, no.4, p.535-41 (April 1983).
DM Vir is a detached eclipsing binary system consisting of two almost identical F6-7 IV-V components. Its period is shown to be about 4.6694^d. Light curves in *UBV* are analyzed by the Wood method. The eclipses are complete and nearly central. The primary eclipse is an occultation and the duration of the complete phase of the eclipses is about 10 minutes. The absolute dimensions of the components are derived and these are shown to be similar to those of the subgiant Procyon. Although DM Vir cannot be regarded as a RS CVn system at present, it is seen as a precursor of this type of star. (18 refs.)

74112 Astrometric studies of ten double or suspected multiple systems from plates taken with the Sproul 61-cm refractor. S.L.Lippincott (Sproul Obs., Swarthmore Coll., Swarthmore, PA, USA).
Astron. J. (USA), vol.88, no.4, p.542-5 (April 1983).
Eight of ten Sproul series of double or suspected multiple systems yield parallaxes with no previously published values from other observatories. Eight systems are unresolved on the photographic plate, one is resolved with the faint component showing magnitude variability, while the remaining system shows elongated images. Only two systems have visual orbit determinations. U CrB, a spectroscopic binary, is suspected to have a distant companion from the orbital period changes, possibly caused by light time variations; the existence of an unseen companion cannot be verified astronomically with the Sproul data. (9 refs.)

74113 The partial phase of the eclipse of epsilon Aurigae. R.D.Chapman, Y.Kondo (Lab. for Astron. & Solar Phys., NASA Goddard Space Flight Center, Greenbelt, MD, USA), R.E.Stencel.
Astrophys. J. Lett. Ed. (USA), vol.269, no.1, pt.2, p.L17-19 (1 June 1983).
Ultraviolet spectra of the peculiar eclipsing binary ϵ Aurigae (F0 Ia+?) were obtained with the International Ultraviolet Explorer at pre-eclipse and ingress partial phases. The results show a wavelength dependence of the eclipse in contrast to the grayness (non-wavelength dependence) of the eclipse observed in visible light. From the current results, incorporating previous observations, the authors suggest that: (a) the obscuration of the light of the F supergiant by the disk proposed by Huang (1965) is the result of electron scattering in visible light; (b) the increase in the eclipse depths toward shorter wavelengths observed in the ultraviolet is caused by dust; and (c) the temperature of the disk is in the range from 1000 to 2000K. (13 refs.)

74114 Photoelectric minima times of the eclipsing binary V508 Ophiuchi. P.Rovithis (Nat. Obs. of Athens, Athens, Greece), H.Rovithis-Livaniou.
Inf. Bull. Variable Stars (Hungary), no.2317, pp.1 (20 April 1983).
The authors report times of three primary minima and three secondary minima of the W Ursae Majoris star V508 Ophiuchi, obtained from photoelectric BV photometry during 1981. In addition, O−C values, calculated from the ephemeris of Kukarkin, are presented. (3 refs.)

74115 Epochs of minimum light for several eclipsing binaries. D.R.Faulkner, R.H.Kaitchuck (Astron. Dept., Indiana Univ., Bloomington, IN, USA).
Inf. Bull. Variable Stars (Hungary), no.2321, pp.2 (22 April 1983).
The authors report photoelectric times of minimum light for six eclipsing binary stars, namely BX Andromedae, U Cephei, V366 Cygni, TZ Eridani, SW Lacertae and RW Tauri. These minimum light times were obtained between 1976 September 12 and 1982 October 22 by means of UBV photometry. (7 refs.)

74116 A field guide to the binary stars. V.Trimble (Astron. Program., Univ. of Maryland, College Park, MD, USA).
Nature (GB), vol.303, no.5913, p.137-42 (12 May 1983).
For most of the history of binary star astronomy, systems have been classified largely on the basis of how they were discovered and qualitative appearance of their spectra and light curves. Understanding of single and double star evolution has now progresed to the point where most of the classes previously identified, and some new ones, can be arranged into evolutionary sequences, depending primarily on the initial masses and separation of the component stars. (163 refs.)

74117 Post-Newtonian gravitational radiation of a system of two compact objects in the field theory of gravitation. A.A.Vlasov (Sci.-Res. Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
Theor. & Math. Phys. (USA), vol.52, no.3, p.888-93 (Sept. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.52, no.3, p.414-22 (Sept. 1982). [received: May 1983]
The gravitational radiation of a binary system of static spherically symmetric bodies whose sizes are small compared with their separation is studied in the post-Newtonian approximation in the field theory of gravitation. (5 refs.)

97.90 OTHER TOPICS IN STELLAR ASTRONOMY

74118 UBVRI photometric standard stars around the celestial equator. A.U.Landolt (Louisiana State Univ., Baton Rouge, LA, USA).
Astron. J. (USA), vol.88, no.3, p.439-60 (March 1983).
UBVRI photoelectric observations have been made of 223 stars mostly in an approximate two degree band centered in the celestial equator. The observing program was planned to provide new UBVRI standard stars, available to telescopes of a variety of sizes in both hemispheres, on an internally consistent homogeneous system around the sky. Most of the stars are in Selected Areas 92-115. The stars average 20.7 measures each on 12.2 different nights. The stars in this paper fall in the range $7 \lesssim V \lesssim 12.5$ and $-0.3 \lesssim (B-V) \lesssim +2.0$. (95 refs.)

98.00 STELLAR SYSTEMS; GALACTIC AND EXTRAGALACTIC OBJECTS AND SYSTEMS; THE UNIVERSE

98.10 STELLAR DYNAMICS

74119 On the equilibrium configurations of prolate, axisymmetric stellar systems. C.L.Bohn (Dept. of Astron. & Astrophys., Univ. of Chicago, Chicago, IL, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.646-66 (15 May 1983).
Constructs and describes a family of equilibrium configurations of nonrotating, axisymmetric, prolate stellar systems. The family spans mass distributions which range from nearly homogeneous configurations through configurations having compact cores surrounded by relatively tenuous envelopes of infinite extent. The prolate shapes span the range of ellipticities observed in elliptical galaxies. (43 refs.)

98.20 STELLAR CLUSTERS AND ASSOCIATIONS

74120 NGC 6067 and three Cepheids. O.J.Eggen (Cerro Tololo Inter-American Obs., La Serena, Chile).
Astron. J. (USA), vol.88, no.3, p.379-85 (March 1983).
NGC 6067 is a small, compact cluster some 6×10^7 yr old and, at a distance of 1.25 kpc, is superposed on, but a kpc closer than, the association Norma OB1. Several of the unusual features noted in the color-luminosity array by Thackeray, Wesselink, and Harding are caused by including association stars among the cluster members. A newly discovered Cepheid, CPD −53°7400 A (11.3^d), is a central star in the cluster but is a member of the more distant association, as is the Cepheid GN Nor (3.4^d). HD 144972 (3.8^d), a newly discovered Cepheid on the border of the cluster, is probably a cluster member. The new variable, −57°7400 A, is compared with the bright, small amplitude Cepheid ζ Gem in an appendix. (23 refs.)

74121 Search for new variable stars in NGC 5927, 5946, and 6144. M.H.Liller (Harvard-Smithsonian Center for Astrophys., Cambrige, MA, USA).
Astron. J. (USA), vol.88, no.3, p.404-9 (March 1983).
New searches have been made for variable stars in the region of the globular clusters NGC 5927, 5946, and 6144. No new variables were found in NGC 5927, which appears to contain only slow, red variables. Four new variables were found within the tidal radius of NGC 5946, of which one and possibly a second are RR Lyrae types. One of the previously known variables is also of this type. In addition seven new field variables were found in the outskirts of NGC 5946. In the region of NGC 6144, one new slow variable was discovered; the previously known variable is probably of RR Lyrae type, but is probably not a cluster member. (18 refs.)

74122 The Cyanogen inhomogeneity of NGC 362. G.H.Smith (Mount Stromlo & Siding Spring Obs., Australian Nat. Univ., Woden, Australia).
Astron. J. (USA), vol.88, no.3, p.410-17 (March 1983).
The cyanogen distribution among the subgiants in NGC 362 has been investigated by using a panoramic photometry technique employing narrowband filters designed to measure the strength of the λ 3883 CN band. This distribution is found to be bimodal, with a heavy preference towards CN-rich stars. The cyanogen variations are found among giants two magnitudes fainter than the Sweigart and Mengel critical luminosity at which CN surface abundance variations are predicted to first appear. (40 refs.)

98.40 INTERSTELLAR MATTER; AND NEBULAE

74123 Distribution of forbidden neutral carbon emission in the Ring Nebula (NGC 6720). D.C.Jewitt (Palomar Obs., California Inst. of Technol., Pasadena, CA, USA), P.N.Kupferman, G.E.Danielson, S.P.Maran.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.683-8 (15 May 1983).
The spatial distribution of [C I] 9823, 9850 Å emission in NGC 6720 is reported. Like [O I], the [C I] radiation appears enhanced in the region of the bright filaments. A few percent of the carbon atoms in the filaments are neutral. This neutral fraction is consistent with ionization equilibrium calculations made under the assumption of complete shielding of direct stellar radiation by hydrogen. The observed carbon lines are excited by photoelectrons produced from hydrogen by the nebular diffuse radiation field. The [C I] observations confirm that the filaments in NGC 6720 are regions of locally enhanced shielding. (15 refs.)

74124 Interstellar Hα emission along the galactic equator. R.J.Reynolds (Phys. Dept., Univ. of Wisconsin, Madison, WI, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.698-709 (15 May 1983).
Hα emission-line profiles were obtained at 2° intervals from galactic longitude 0° to 240° at $b=0°$. Galactic Hα emission was detected in every direction with an intensity that ranged from 7.5×10^{-7} ergs cm^{-2} s^{-1} sr^{-1} at $l=44°$ and 154° to 1.2×10^{-4} ergs cm^{-2} s^{-1} sr^{-1} at 86°. Variations in the intensity along the galactic equator reveal many faint emission regions with electron densities of ~1-3 cm^{-3}, which appear to be superposed on a more uniform Hα background requiring an rms electron density of ~0.1 cm^{-3}. The radial velocities of the emission components indicate that both the diffuse background and the more discrete emission regions are concentrated in the spiral arms. These data complement photographic and radio surveys by providing absolute Hα intensities and radial velocities in 121 evenly spaced, 0.8° diameter fields down to a limiting emission measure of about 2 cm^{-6} pc. (29 refs.)

74125 IR maps of M17 in the [O III] 88 micron and 52 micron lines and [N III] 57 micron line measurements. R.J.Emery, D.A.Naylor, B.Fitton (Space Sci. Dept., ESA, Noordwijk, Netherlands), I.Furniss, R.E.Jennings, K.J.King.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.721-6 (15 May 1983).
Observations of the IR fine-structure lines of [O III] and [N III] from M17 were made using a balloon-borne 60 cm diameter telescope and a Michelson interferometer of 0.05 cm^{-1} resolution. The FWHM beam size was 1′.65. These data are combined with earlier published data on these lines from airborne and balloon observations to provide the first extensive far-IR line maps of M17 and an electron density map derived from the [O III] line ratios. (18 refs.)

74126 Warm H I halos around molecular clouds. P.G.Wannier, S.M.Lichten (Dept. of Astron., California Inst. of Technol., Pasadena, CA, USA), M.Morris.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.727-38 (15 May 1983).
Observations of H I have been made with the 305 m Arecibo dish toward the isolated edges of several molecular clouds. Comparison with 1.3 and 2.6 mm CO line emission indicates the existence of H I halos extending 0.5 to several pc beyond the CO boundaries. Because the halos appear in emission against the ~100K galactic H I background, the gas is evidently warmer than much of the interstellar H I gas. The observed column densities and transition zone thicknesses agree well with steady state calculations equating the formation rate of H_2 on grains to its destruction by UV radiation. (29 refs.)

74127 Stellar winds and molecular clouds: T Tauri stars. N.Calvet (Centro de Investigacion de Astron., Merida, Venezuela), J.Canto, L.F.Rodriguez.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.739-52 (15 May 1983).
The authors have searched for high-velocity molecular gas in the environment of 12 T Tauri stars associated with optical nebulosities. The molecular gas associated with T Tau and HL and XZ Tau clearly showed carbon monoxide line wings extending at least over ~ 15 km s^{-1}. HL and XZ Tau are located in the molecular cloud L 1551, where an independent outflow powered by an infrared source has been reported. The existence of two separate centers of gas outflow in L1551 suggests that the phenomenon is common. The rate of momentum being injected by stars as T Tau and HL and XZ Tau into their molecular surroundings is large, $\gtrsim 10^{-6}$ $M_{\odot}$ km s^{-1} yr^{-1}. These rates are higher than those expected from the radiative momentum rate of the stars alone, but comparable with those derived from optical observations of T Tau winds. (56 refs.)

74128 MSH 15−52: a supernova remnant containing two compact X-ray sources. F.D.Seward, F.R.Harnden,Jr. (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA), P.Murdin, D.H.Clark.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.698-710 (15 April 1983).
Einstein observations show two small-diameter, bright X-ray sources within the shell of the galactic radio supernova remnant (SNR) MSH 15−52. X-ray spectra and optical extinction indicate that both compact sources are at least as distant, 4.2 kpc, as the diffuse emission from the shell. There is also enhanced, diffuse emission in the vicinity of both compact sources, as well as coincident with the radio shell. The source closest to the middle of the remnant is hard, was previously detected as 4U 1510−59, and shows strong regular X-ray pulsations with a period of 0.150 s. The second source is associated with a collisionally excited, high-density, optical knot within the Hα nebula RCW 89 close to the northwestern rim of the SNR. CCD observations with the Anglo-Australian Telescope yield possible reddened candidates for 4U 1510−59 and map the optical knot. UK Schmidt telescope photographs of RCW 89 show new filaments which extend into MSH 15−52 and support the hypothesis that the Hα nebula is part of the whole SNR. The authors discuss the interaction of the supernova ejecta with the interstellar medium, the possibility that the ages of the pulsar and the SNR are less discrepant than they first appear, and the possibility that a second pulsar powers the knot and RCW 89. (55 refs.)

74129 The structure of bright-rimmed molecular clouds. A.Wootten, A.Sargent, G.Knapp (Owens Valley Radio Obs., California Inst. of Technol., Pasadena, CA, USA), P.J.Huggins.
Astrophys. J. (USA), vol.269, no.1, pt.1, p.147-64 (1 June 1983).
Five bright-rimmed molecular clouds, NGC 1977, IC 1396, IC 1848A, B35, and NGC 7822, have been mapped with 30″ resolution in the $J=2$-1 lines of ^{12}CO. For the first three, ^{13}CO maps have also been made. The spatial distributions of temperature, density, and molecular abundance in these clouds are determined, particularly in the vicinity of the rims. In general, the gas densities increase close to the rims, but temperature enhancements occur over comparatively extended regions. Near the rims the gas kinematics is varied: velocity gradients are observed in several regions, and in IC 1396 line broadening is distinguishable. A detailed study of the excitation of ^{13}CO demonstrates that near the well-resolved rim in NGC 1977 where C I and carbon recombination lines have been observed, there is a definite decline in the CO abundance. (56 refs.)

74130 A study of Hα velocities in NGC 1499, NGC 7000, and IC 1318B/C. W.F.Fountain, G.A.Gary, C.R.O'Dell (NASA, George C. Marshall Space Flight Center, AL, USA).
Astrophys. J. (USA), vol.269, no.1, pt.1, p.164-74 (1 June 1983).
Multiple slit echelle spectrograph observations of the Hα emission line are used to map the radial velocities of the California Nebula (NGC 1499), the North American Nebula complex (NGC 7000 and IC 5070), and IC 1318B/C. The California Nebula is singularly constant in velocity, considering its geometry. The North American Nebula complex reflects a very simple, classical dynamical picture. The expansion discovered earlier in IC 1318B/C is confirmed, detailed, and the model refined. (38 refs.)

74131 The M17 SW molecular cloud. H.A.Thronson,Jr. (Wyoming Infrared Obs., Univ. of Wyoming, Laramie, WY, USA), C.J.Lada.
Astrophys. J. (USA), vol.269, no.1, pt.1, p.175-81 (1 June 1983).
Reports ^{12}CO and ^{13}CO observations of the massive molecular cloud associated with the giant M17 H II region. The authors find the brightest ^{12}CO emission to lie in an elongated ridge, parallel and adjacent to a sharp ionization front at the apparent H II/H_2 interface. The highest temperature ^{12}CO emission is coincident with the brightest 100 μm emission. That this was not seen in earlier, lower resolution ^{12}CO maps suggest a very steep molecular temperature gradient across the ionization front and emphasizes the uncertainties of using finite-sized beams. With the new data the molecular dissociation front is located. The radio molecular data also support the idea of a dusty molecular cloud that is largely externally heated by the exciting stars of the M17 H II region. These enormously luminous stars may be masking significant star-forming activity within the molecular cloud itself. (25 refs.)

74132 The surface brightness of reflection nebulae: NGC 1432 and the 17 Tauri nebulosity. M.J.Cottrell (BDM Corp., Columbia, MD, USA), A.N.Witt.
Astron. J. (USA), vol.88, no.3, p.418-26 (March 1983).
New photoelectric surface brightness measurements of the reflection nebulae near 20 Tau and 17 Tau are reported for intermediate width bandpasses centered near 3500, 4100, 4700, and 5500 Å. The derived surface brightness distributions have been used to set limits on the density and the spatial extent of the dust clouds near these stars. NGC 1432 (20 Tau) can be represented successfully by either an inclined plane-parallel dust slab with the star in front or by an extended, optically thin spherical shell surrounding 20 Tau. The 17 Tau nebulosity is most easily modelled by an extended spherical cloud of low uniform density. A comparison of the absolute surface brightness of four reflection nebulae, NGC 7023, NGC 1435, NGC 1432, and the 17 Tau nebulosity, shows the latter two to be relatively inefficient producers of scattered light. (33 refs.)

74133 Intensity and extinction irregularities in the H_2 emission from Orion. H.A.Smith (E.O. Hulburt Center for Space Res., Naval Res. Lab., Washington, DC, USA), H.P.Larson, M.A.Feierberg, U.Fink.
Astron. J. (USA), vol.88, no.3, p.469-675 (March 1983).
Fourteen lines of the $\nu=1$-0 and $\nu=2$-1 2 μm H_2 quadrupole spectrum were measured in a series of ground-based spectroscopic observations of four locations within the Orion molecular cloud-H_2 emission complex. Beam sizes of 7″ and 10″ were used, with a resolution of 1.8 cm^{-1}. The results indicate that there are differences in the extinction between regions of as much as $\delta A_V \simeq 20$ mag. In particular there appears to be a ridge of material near the object IRS 2 (=IR*c* 9), a previously suggested source of activity. The 2-1 S (3) line intensity is substantially stronger at Peak 2 than the present models predict, and this observation is the first indication that there may be a non-Boltzmann distribution within the vibrational levels of shock-excited H_2. The authors also report a detection of the 1-0 Q (6) line, a feature which was previously absent in spectra of the Orion cloud. (25 refs.)

74134 High-velocity iron absorption lines in supernova remnant 1006. C-C.Wu (Computer Sci. Corp., Baltimore, MD, USA), M.Leventhal, C.L.Sarazin, T.R.Gull.
Astrophys. J. Lett. Ed. (USA), vol.269, no.1, pt.2, p.L5-9 (1 June 1983).
The International Ultraviolet Explorer spectrum of the Schweizer-Middleditch star projected near the center of supernova remnant 1006 shows an sdOB star continuum, with very strong, broad absorption lines. Strong Fe^{+} resonance abosorption lines are present. Their centers show zero radial velocity, while their profiles are broadened by ~ 5-6×10^{3} km s^{-1}. Redshifted $Si^{+,+2,+3}$ lines at $\nu_r \sim 5\times 10^{3}$ km s^{-1} have also been tentatively identified. The authors argue that the absorptions must occur in the ejecta of the supernova. The strength and symmetric width of the Fe^{+} lines suggest that the bulk of the ejecta is iron, in agreement with the current theory for the origin of Type I supernovae. The previous failure to detect strong Fe emission lines in the X-ray spectrum of this and other young Type I SNRs suggests that the ejecta may not have had time to interact significantly with the ambient medium. (13 refs.)

74135 Detection of interstellar NH_3 in the far-infrared: warm and dense gas in Orion-KL. C.H.Townes, R.Genzel, D.M.Watson (Dept. of Phys., Univ. of California, Berkeley, CA, USA), J.W.V.Storey.
Astrophys. J. Lett. Ed. (USA), vol.269, no.1, pt.2, p.L11-15 (1 June 1983).
Reports the detection of the $(J,K)=a(4,3)\rightarrow s(3,3)$ rotation-inversion transition of ammonia at 124.6 μm towards the center of the Orion-KL region. The far-IR ammonia line emission probably comes mainly from the 'hot core', a compact region of warm, very dense gas previously identified by the radio inversion lines of NH_3. The $a(4,3)\rightarrow s(3,3)$ line is very optically thick $(\tau \sim 10^{3})$, and since it is seen in emission, radiative excitation of the (4,3) NH_3 level by far-IR emission from dust within the source can be ruled out. The (4,3) level is probably collisionally excited and the gas in the hot core region is warmer than the dust. Densities of $\sim 10^{7}$ cm^{-3} are high enough to explain the observations. Shock heating by the mass outflow from IRc2 may account for the high gas temperatures in the hot core region. (26 refs.)

74136 Magellanic Cloud planetary nebula with suspected strong forbidden iron lines. L.H.Aller (Astron. Dept., Univ. of California, Los Angeles, CA, USA), S.J.Czyzak.
Proc. Natl. Acad. Sci. USA, vol.80, no.6, p.1764-6 (March 1983).
The relatively high-excitation nebula (Westerlund-Smith object 25) in the Large Magellanic Cloud shows prominent forbidden lines of [ArIV], the close [Ne IV] pair λ4724, 4726, [Ca V] λ5309, [Fe V] λ4227, and probably [Fe VI] and [Fe VII], as well. A conventional interpretation of observations secured with a vidicon detector at the Cerro Tololo 4-m telescopes indicates an essentially 'normal' helium abundance but depletions of N, O, Ne, and other elements with respect to the Galaxy. When a comparison is made with diffuse neblae of H II regions in the Large Magellanic Cloud, the authors find helium to be more abundant, oxygen to be depleted, and nitrogen, neon, and argon to be comparable. The abundance of sulfur is uncertain. Iron in the gaseous phase is certainly more plentiful than in conventional planetaries. (15 refs.)

74137 The densities of charged particles in very dense interstellar clouds. T.Umebayashi (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.2, p.480-502 (Feb. 1983).
The author examines the following proceses on the grain surface: the adsorption of ions and electrons to the surface; the recombination of ions and electrons at grain-ion, grain-electron and grain-grain collisions; and desorption of ions and electrons from the surface. As the temperature increases, the sticking probability of electrons to the surface is found to decrease to 0.1 or lower, while that of ions remains very close to unity. Above a certain critical temperature around several hundred kelvin, the desorption becomes abruptly efficient. Solving the rate equations for chemical and grain-surface reactions, the author investigates the abundances of various charged particles in very dense interstellar clouds (protostars). As long as the desorption is inefficient, grains with one excess ion and with one excess electron are the major constituents among charged particles at densities higher than 10^{10} cm^{-3}. When the desorption becomes efficient, electrons and ions in the gas phase increase extensively as charged grains decrease. At the temperature above about 10^{3}K the thermal ionization dominates over the other processes of ionization, and the ionization degree increases extensively with the temperature. (20 refs.)

98.50 THE GALAXY, EXTRAGALACTIC OBJECTS AND SYSTEMS

74138 The Galaxy as fundamental calibrator of the extragalactic distance scale. I. The basic scale factors of the Galaxy and two kinematic tests of the long and short distance scales. G.de Vaucouleurs (Dept. of Astron., Univ. of Texas, Austin, TX, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.451-67 (15 May 1983).
A new version of the oldest approach to estimating the distances of galaxies—direct comparison with the Galaxy—is proposed to relate the extragalactic distance scale to the basic metric, photometric, and kinematic scale factors of the Galaxy. These include the galactocentric distance of the Sun, the total magnitude of the Galaxy, and its spheroidal component, the galactic rotation velocity of the local standard of rest, the central velocity dispersion of the spheroidal component, and related parameters. (87 refs.)

74139 The Galaxy as fundamental calibrator of the extragalactic distance scale. II. Comparisons of metric and photometric scale lengths and three further tests of the long and short distance scales. G.de Vaucouleurs (Dept. of Astron., Univ. of Texas, Austin, TX, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.468-75 (15 May 1983).
For pt.I see ibid., vol.268, no.2, pt.1, p.451-67 (1983). Metric and photometric parameters of the Galaxy are used to perform three further tests of the extragalactic distance scales. The validity of the Galaxy as a standard is discussed. The time scale argument often used as a prop to the long scale is shown to be inconclusive. (59 refs.)

74140 Monte Carlo simulations of the evolution of galactic nuclei containing massive, central black holes. M.J.Duncan, S.L.Shapiro (Center for Radiophys. & Space Res., Cornell Univ., Ithaca, NY, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.565-81 (15 May 1983).
A Monte Carlo scheme previously used to study the dynamical evolution of globular clusters is modified to simulate the evolution of dense galactic nuclei containing massive central black holes. The black hole is assumed to accrete the debris from stars which are either tidally disrupted by the hole or destroyed in direct physical collisions with other stars. The implications for quasar magnitudes and redshifts are briefly considered. (25 refs.)

74141 Star-burst galactic nuclei. V.A.Balzano (Dept. of Astron., Pennsylvania State Univ., University Park, PA, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.602-27 (15 May 1983).
A survey of galaxies with star-burst nuclei was conducted to investigate their basic properties and to discover their relationship to other extragalactic objects. Spectrophotometric observations of 102 nuclei were obtained. These objects, which were primarily selected from the Markarian lists, have spectra characterized by strong, narrow, low-ionization emission lines. Their optical colors, emission-line properties, and radio continua can consistently be explained by the presence of young, hot star populations within these nuclei. Infrared J, H, and K magnitudes are now available for 50 star-burst nuclei. There is no correlation between the infrared and emission-line radiation from these objects. The near-infrared data, therefore, refers primarily to the older, cool star population. The space densities of this star-burst nuclei sample are tabulated as a function of $H\alpha$ luminosity. (88 refs.)

74142 Enhanced radio emission in merging galaxies. T.M.Heckman (Astron. Program, Univ. of Maryland, College Park, MD, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.628-31 (15 May 1983).
Selects examples of systems believed to represent mergers between spiral galaxies from the Arp, Atlas of Peculiar Galaxies. This sample of mergers is compared to two samples of spiral galaxies, in terms of radio power. The first comparison sample consists of galaxies with the same optical luminosities as the mergers. The second comparison sample is that subset of the first sample in which the galaxy is part of a double or multiple system. (25 refs.)

74143 The distribution of ionized gas in the nuclei of spiral galaxies. W.C.Keel (Lick Obs., Univ. of California, Santa Cruz, CA, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.632-7 (15 May 1983).
Narrow-band digital images have been obtained for a sample of spiral galaxies selected to contain low-ionization emission regions in their nuclei. The images have been processed to yield pure $H\alpha+$[N II] images. These show that the optically emitting gas is usually concentrated in a nearly spherical core of half-intensity diameter typically 200 pc, often surrounded by a disk, in the galactic plane, traceable over a 600-900 pc diameter. This gas disk is not present in several cases in which it is expected by comparison with others of similar luminosity in emission, showing that some morphological variety exists among these emission regions. (24 refs.)

74144 Estimating the tumble rates of galaxy halos. G.F.Simonson (Yale Univ. Obs., New Haven, CT, USA), J.E.Tohline.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.638-45 (15 May 1983).
Shows that if a static spheroidal galaxy rigidly tumbles about a nonsymmetry axis, the preferred orientation of the gas can become a permanently and smoothly warped sheet, in which rings of gas at large radii may be fully orthogonal to those near the galaxy's core. Detailed numerical orbit calculations closely match an analytic prediction made previously for the structure of the warp. This structure depends primarily on the eccentricity, density profile and tumble rate of the spheroid. Two peculiar systems, NGC 5128 and NGC 2685, are examined. (18 refs.)

74145 Blue compact dwarf galaxies. II. Near-infrared studies and stellar populations. Trinh X. Thuan (Astron. Dept., Univ. of Virginia, Charlottesville, VA, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.667-82 (15 May 1983).
For pt.I see ibid., vol.247, no.3, p.1, p.823-48 (1981). The results of an infrared photometric survey at J (1.2 μm), H (1.65 μm), and K (2.2 μm), of 36 blue compact dwarf galaxies (BCDG) where intense bursts of star formation are occurring, are presented. All galaxies were detected at a few mJy level. These near-infrared fluxes are probably due to an old population of K and M giants. BCDG follow a $J-K$ color-metallicity relationship similar to that for globular clusters. BCDG follow a well defined color-luminosity relationship suggesting that star formation processes in these galaxies are intimately linked to their total masses. (35 refs.)

74146 NGC 1275: a burgeoning elliptical galaxy. A.Wirth, S.J.Kenyon, D.A.Hunter (Dept. of Astron., Univ. of Illinois, Urbana, IL, USA).
Astrophys. J. (USA), vol.269, no.1, pt.1, p.102-6 (1 June 1983).
Presents large-aperture spectrophotometry of the peculiar galaxy NGC 1275. Emission lines from $H\beta$, [O II], [O III], and [Ne III] dominate this spectrum, while $H\delta$, $H\varepsilon$ and Na D appear in absorption. A population synthesis model for the absorption-line spectrum suggests that $\sim$20% of the optical luminosity is produced by B stars. On the basis of this and the calculated $H\beta$ emission line flux the authors estimate the current star formation rate in NGC 1275. This leads to a predicted supernova rate of 1 yr^{-1}. The resulting supernovae heating rate is $\sim$one-half the cooling rate predicted by current accretion models and may thus significantly alter the accretion flow. The authors propose that in NGC 1275 we may be witnessing the formation of an elliptical galaxy in the cluster potential. (43 refs.)

74147 X-ray and optical studies of emission-line Markarian galaxies. J.S.Ulvestad (Nat. Radio Astron. Obs., Charlottesville, VA, USA), A.S.Wilson.
Astron. J. (USA), vol.88, no.3, p.253-9 (March 1983).
The X-ray and optical properties of a selection of compact nucleus, emission line Markarian galaxies have been studied. Observations with the Einstein Observatory have detected X-rays from all the Seyfert galaxies and none of the narrow emission line galaxies in the sample. This result supports the idea that powerful X-ray emission is correlated with the presence of a broad optical emission line component. The emission line spectra of the Seyfert galaxies show much higher excitation than do the narrow-line galaxies, whose spectra are similar to those of H II regions. Both the optical properties and the radio and X-ray upper limits of the non-Seyfert galaxies are consistent with the suggestion that those objects have undergone bursts of massive star formation. (38 refs.)

74148 Sensitive mapping of E and S0 galaxies in search of H I content differences between supernovae and nonsupernovae producing galaxies. C.K.Kumar (Dept. of Phys., & Astron., Howard Univ., Washington, DC, USA), N.Thonnard.
Astron. J. (USA), vol.88, no.3, p.260-6 (March 1983).
Thirteen elliptical and S0 galaxies in the Virgo and Pegasus I clusters have been mapped over their optical extent in the 21-cm neutral hydrogen line with the 305-m Arecibo telescope. No neutral hydrogen was detected in any of the galaxies, including NGC 4636, which had previously been reported as containing H I. New upper limits to the H I content of these galaxies ($\sim 5\times 10^7$ $M_\odot$ in Virgo) are presented. The authors discuss their implications for the origin of Type I supernovae and the mechanisms for gas removal from elliptical galaxies. (29 refs.)

74149 Neutral hydrogen in isolated galaxies. II. The large angular diameter galaxies. J.N.Hewitt (Dept. of Phys., MIT, Cambridge, MA, USA), M.P.Haynes, R.Giovanelli.
Astron. J. (USA), vol.88, no.3, p.272-95 (March 1983).
For pt.I see Astrophys. J. Lett. Ed., vol.240, no.2, p.L87-91 (1980). Fifty-two of the large angular diameter ($a\geq 2.5'$) galaxies included in the 21-cm survey of isolated galaxies being undertaken at Arecibo by Haynes and Giovanelli have been mapped along their optical major axes using the 305-m telescope and the low sidelobe flat feed system. The observed fluxes have then been compared with a numerical convolution of an assumed H I distribution $\sigma_H(r)$ and the beam pattern $G(\theta)$ to produce an estimate of the characteristic size. The derived H I scale length R_{70} is that radius interior to which 70% of the model's H I mass is contained. With still a significant scatter, the H I diameter $D_{70}=2R_{70}$ is on the average about 1.2 times the UGC blue diameter a, and shows no dependence on morphological type for types later than Sa. Application of the observed relationship between H I size and optical diameter and of an assumed double Gaussian (centrally depressed) H I surface density distribution produces proper corrections for source to beam size. Corrected fluxes derived from Arecibo data do not differ systematically from those measured at the 91-m telescope, proving the applicability of the calibration and correction procedure. The H I mass M_H is shown to be nearly proportional to the square of the linear H I diameter, implying that the H I surface density averaged over the disk is almost constant. (24 refs.)

74150 A color-magnitude diagram for Leo II. S.Demers (Univ. de Montreal, Montreal, Quebec, Canada), W.E.Harris.
Astron. J. (USA), vol.88, no.3, p.329-37 (March 1983).
For the dwarf spheroidal galaxy Leo II, the authors present a color-magnitude diagram to $V_{\mathrm{lim}}\simeq 22$, derived from CFHT prime focus plates.The CMD reveals a moderately wide red giant branch with its brightest stars at $V\simeq 19.4$, $(B-V)\simeq 1.8$, similar in morphology to the giant branch of Fornax. From the magnitude level of the giants, the authors estimate that Leo II is (230 ± 20) kpc distant, far enough that its physical association with our galaxy may be questioned. Star counts made from the deepest B plate show that the surface density profile of Leo II is well matched by a King model with $\log(r_t/r_c)=0.5$ and $r_t=10.7'$. (27 refs.)

74151 Globular cluster orbits and the galactic mass distribution. K.A.Innanen (Phys. Dept., York Univ., Toronto, Ontario, Canada), W.E.Harris, R.F.Webbink.
Astron. J. (USA), vol.88, no.3, p.338-60 (March 1983).
Investigates both the shapes of typical globular cluster orbits and the distribution of galactic mass with distance, using the globular cluster tidal radii as probes of the galactic gravitational field at their perigalactic points. Starting from the way in which cluster energies and angular momenta interact with the galactic potential, the authors discuss the relationship between the cluster tidal radius and its perigalactic distance, as well as the expected distribution of tidally limited cluster densities. By then comparing the observed cluster radii and densities, the authors draw the following conclusions: (1) Random measurement errors (particularly of the observed tidal radii) are so large that individual estimates of cluster perigalactic are largely meaningless. (2) If one assumes a typical globular cluster mass-to-light $(m/l)_V=1.7$, the resulting shapes of the cluster orbits implied by their tidal radii are too nearly circular to be consistent with their velocity dispersions. Instead, an m/l ratio two or three times higher is needed to make their orbital properties agree with those deduced from their radial velocities. (3) The intrinsic dispersion in cluster mean densities at a given galactocentric distance is small enough to preclude any clusters having highly elongated orbits (i.e. low dimensionless angular momenta). The globular clusters must therefore have a toroidal, rather than spheroidal, distribution in velocity space, with the axis pointed toward the galactic center. (4) There is little change in the dispersion of cluster densities with galactocentric distance, indicating that radial trends in the kinematics of the cluster system are small. (54 refs.)

74152 Redshifts for 115 galaxies near the equator. S.A.Shectman (Mount Wilson & Las Campanas Obs., Pasadena, CA, USA), R.P.Stefanik, D.W.Latham.
Astron. J. (USA), vol.88, no.4, p.477-82 (April 1983).
The authors report new redshifts for 115 bright galaxies located near the celestial equator. The spectra were observed with a blue-sensitive photon-

counting Reticon on the 100-in DuPont telescope, and the redshifts were derived using the data-analysis system developed for the CfA Redshift Survey. Comparisons with other measured redshifts suggest that these data are similar in quality to the redshifts measured at Mt. Hopkins for the CfA Redshift Survey; the velocity zero point is good to 10 or 15 km s^{-1}, with a typical error of 35 km s^{-1} for the individual measurements. (13 refs.)

74153 On the evolution of the spiral galaxies in the Virgo cluster. R.C.Kennicutt,Jr. (Dept. of Astron., Univ. of Minnesota, Minneapolis, MN, USA).
Astron. J. (USA), vol.88, no.4, p.483-8 (April 1983).
Integrated Balmer emission line fluxes have been measured for 26 spiral galaxies in the core of the Virgo cluster. They are combined with published 21-cm and *UBV* color data in order to compare the disk properties of the cluster galaxies with galaxies in the field. Virgo spirals of a given Hubble type possess less star formation, less neutral hydrogen, and are redder than their field counterparts. Various possible selection effects are examined, but they cannot explain the differences. The relationships between color, $M_{\rm H}/L$ and Hα strengths, however, are indistinguishable in Virgo and the field. Some of the Virgo spirals may simply be normal spirals of slightly earlier type, but at least a few appear to be genuinely anemic galaxies, as suggested by van den Bergh. (17 refs.)

74154 21-cm observations of galaxies in groups and multiplets. J.W.Sulentic (Dept. of Phys. & Astron., Univ. of Alabama, University, AL, USA), H.Arp.
Astron. J. (USA), vol.88, no.4, p.489-506 (April 1983).
Measures at the 21-cm line of neutral hydrogen are reported for a large sample of individual galaxies in groups as well as for interacting multiple-component systems. The observations of single galaxies were designed to study differential redshifts within groups. Observations of interating systems were undertaken to obtain system redshifts as well as 21-cm profile morphology. The data, which will be used in future analyses, are presented here along with a discussion of interaction morphology from the 21-cm profile point of view. Together the profile samples encompass the full range of dynamical states in which the gas components of galaxies are observed, from relaxed to violently disrupted. (29 refs.)

74155 Photometry of Cepheids in the LMC and Magellanic Cloud abundances. H.C.Harris (Dominion Astrophys. Obs., Herzberg Inst. of Astrophys., Victoria, British Columbia, Canada).
Astron. J. (USA), vol.88, no.4, p.507-17 (April 1983).
Washington-system colors of 40 Cepheids in the Large Magellanic Cloud are used to study the metal abundances within the LMC and to compare with abundances in the SMC and the Galaxy. The LMC Cepheids are quite homogeneous: they show a dispersion in observed $[A/H]$ of ± 0.14, probably due to a width for the instability strip of about $0.07^{\rm m}$ in T_1-T_2 (about 400K) combined with a real dispersion in $[A/H]$ of ± 0.1. Neither they nor SMC Cepheids show the correlation of residuals from the $P-L$ relation with abundance which has been predicted based on evolutionary models. The values of reddening found within the LMC are weakly correlated with H I column density, and are sufficiently small [mean $E(T_1-T_2)=0.04^{\rm m}$] that the derived dust/gas ratio in the LMC is 0.4 times that in the Galaxy. No gradient in abundances within the LMC is found, either with east-west position or radially. It is suggested that variations both in the B/R ratio of supergiants and in the mean periods of Cepheids across the LMC might be better explained by variations in the rate of star formation rather than by abundance variations. The abundances of the LMC and SMC Cepheids relative to Galactic Cepheids are found to be -0.09 and -0.65, respectively, and are compared with results from other studies. (44 refs.)

74156 NGC 4151. H.Schulz, J.Fried, H.Hippelein.
I.A.U. Circ. (USA), no.3813, 1 pp. (18 May 1983).
It is reported that a pronounced narrow depression appeared in the blue wing of broad-line Hα in the Seyfert galaxy NGC 4151 in a 5-minute reticon spectrum taken on 1983 March 30. The presence of this feature is confirmed by a photographic image-tube spectrum taken on May 3, although the broad emission wings may have become stronger in the meantime. The feature is probably related to the transient blueshifted Balmer absorption detected by Anderson and Kraft (1969). (2 refs.)

74157 Intergalactic shock waves. V.V.Chernomordik, L.M.Ozernoy (Dept. of Theoretical Phys., Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Nature (GB), vol.303, no.5913, p.153-5 (12 May 1983).
Young galaxies as well as quasars and active galactic nuclei, have long been considered as possible sources of shock waves entering the intergalactic medium. Following convincing evidence that the narrow absorption lines seen shortward of the Lyα emission line in very distant quasars are mostly intervening (and not intrinsic) Lyα absorption lines, various attempts have been made to relate the cold H I absorbers (in part, at least) with actual shock waves in the intergalactic medium. The authors consider intergalactic shocks in a low density universe when energy losses from shocks are negligible at the redshifts of interest. However, even at this essentially adiabatic evolution stage, the absorption of the outer radiation in the outermost densest and coldest regions of the shock waves is capable of producing measurable Lyα absorption lines. Moreover, these lines should be observed, due to a specific geometry, in the form of special 'doublets'. The authors demonstrate that there are such doublets in quasar spectra among the Lyα 'forest', and this can apparently be regarded as the first conclusive evidence in favour of intergalactic shock waves. (17 refs.)

74158 Optical polarization position angle versus radio structure axis in Seyfert galaxies. R.R.J.Antonucci (Nat. Radio Astron. Obs., Charlottesville, VA, USA).
Nature (GB), vol.303, no.5913, p.158-9 (12 May 1983).
Optical polarization position angles tend to align with large-scale radio structure in low polarization quasars, and they tend to align with or be perpendicular to the radio structure in radio galaxies. In some cases active object emission lines are polarized like the continuum, so the polarization is probably caused by scattering. Thus, the polarization alignments indicate the geometrical distribution of scatterers in those cases and so provide information on the matter distribution in the innermost regions. In a new interpretation of the Seyfert 2 galaxy NGC 1068, it is noted that the optical polarization of that object is perpendicular to the inner radio contours, while the polarization of the Seyfert 1 galaxy NGC4151 is parallel to the associated radio axis. It is speculated that these are prototypical of two polarization classes of Seyferts analogous to the perpendicular and parallel radio galaxy groups. He shows here that this is indeed the case: all Seyfert 1 galaxies in this sample have roughly parallel polarization and all Seyfert 2 galaxies have roughly perpendicular polarizations. These alignment effects can be interpreted as being due to thin and thick scattering disks, respectively, surrounding the continuum sources. This would represent a fundamental difference between the two types of Seyfert galaxies. (16 refs.)

74159 CCD photometry of Abell clusters. II. Surface photometry of 249 cluster galaxies. D.P.Schneider (Palomar Obs., California Inst. of Technol., Pasadena, CA, USA), J.E.Gunn, J.G.Hoessel.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.476-94 (15 May 1983).
For pt.I see ibid., vol.264, no.2, pt.1, p.337-55 (1983). Presents CCD surface photometry of the brightest three galaxies in the cores of 83 Abell clusters. The 1 σ dispersions in the absolute magnitudes for the first, second, and third ranked cluster galaxies (G1, G2, and G3) are 0.35, 0.55, and 0.65, respectively. The luminosities of G1, G2, and G3 all rise with increasing Abell richness class, but the magnitude difference between them remains roughly the same. The magnitude of G1 is quite sensitive to Bautz-Morgan (BM) class, but there seems to be little relation between BM type and the magnitudes or structure of G2 and G3. The colors of all three are very similar and show no signs of evolution back to redshifts of 0.25. (38 refs.)

74160 Effects of galaxy collisions on the structure and evolution of galaxy clusters. I. Mass and luminosity functions and background light. G.E.Miller (Dept. of Astron., Univ. of Virginia, Charlottesville, VA, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.495-512 (15 May 1983).
The role of galaxy collisions in controlling the form of the galaxy mass and luminosity functions and in creating a diffuse background light is investigated by means of a direct computer simulation. Galaxy collisions are treated in a realistic manner, including both galaxy mergers and tidal encounters. A large number of theoretical studies of galaxy collisions were consulted to formulate the basic input physics of collision cross sections. Despite this large number of studies, there remains considerable uncertainty in the effects of a collision on a galaxy due mainly to the lack of knowledge of the orbital distribution of matter in galaxies. To improve this situation, some methods of semiempirical calibration are suggested—for example, a survey of background light in clusters of different richness and morphological classes. (82 refs.)

74161 Redshift modifications to *HEAO* A-1 cluster X-ray luminosities. M.P.Kowalski, M.P.Ulmer (Northwestern Univ., Evanston, IL, USA), R.G.Cruddace.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.540-51 (15 May 1983).
Spectroscopic redshifts are determined for several of the Abell clusters in the *HEAO* A-1 X-ray catalog. These data are used along with other redshift data to derive revised luminosity functions. A systematic difference between the authors' measured redshifts and estimated redshifts is determined. Redshift corrections to all other clusters in the X-ray catalog are produced to examine the effect of such estimates. Luminosity functions are also created over different distance ranges to search for cluster evolution. Four analytic expressions (exponential, power-law, exponential times power-law, and double power-law) are fitted to all luminosity functions. (23 refs.)

74162 Accretion-driven star formation in central dominant galaxies in X-ray clusters. C.L.Sarazin (Dept. of Astron., Univ. of Virginia, Charlottesville, VA, USA), R.W.O'Connell.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.552-60 (15 May 1983).
Argues that low-mass stars are being formed from the large amounts of gas being accreted by central dominant galaxies in some X-ray clusters. Low-mass star formation may be favored because the Jeans mass decreases as the ambient pressure increases, and the pressures observed in these accretion flows are four orders of magnitude higher than those in the local interstellar medium. The authors calculate the spectra for the inner parts of these galaxies including accretion-driven star formation, and show that the colors of

these galaxies may be affected at an observable level. The authors suggest observations to search for these color anomalies. (55 refs.)

74163 A note on the formation of clusters of galaxies. P.S.Wesson (Dept. of Phys., Univ. of Alberta, Edmonton, Alberta, Canada).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.561-4 (15 May 1983).
Perturbations of a previously given exact, inhomogeneous solution of Einstein's equations are considered as a model for the formation of a cluster of galaxies. It is shown that during the collapse of a cluster, it maintains its smooth density profile over most of its extent. (20 refs.)

74164 21 centimeter observations of supercluster galaxies: the bridge between Coma and A1367. G.L.Chincarini (Univ. of Oklahoma, Norman, OK, USA), R.Giovanelli, M.P.Haynes.
Astrophys. J. (USA), vol.269, no.1, pt.1, p.13-28 (1 June 1983).
Presents 21 cm observations of galaxies in the region of the Coma-A1367 supercluster. It is shown that galaxies near the cluster centers are hydrogen deficient while galaxies which are in between the two clusters have a normal hydrogen content. A crossing time of about 1.7×10^9 yr is defined by the radius of the region of transition between deficient and nondeficient galaxies and the cluster's velocity dispersion. The gas removed by stripping is a small fraction of the gas observed in the X-ray region. (40 refs.)

74165 CO observations of the galaxies in the Leo triplet: NGC 3623, NGC 3267, and NGC 3628. J.S.Young, L.J.Tacconi, N.Z.Scoville (Five College Radio Astron. Obs., Univ. of Massachusetts, Amherst, MA, USA).
Astrophys. J. (USA), vol.269, no.1, pt.1, p.136-46 (1 June 1983).
Observations of the 2.6 mm CO line in the three interacting galaxies of the Leo triplet, made with the 14 m FCRAO telescope (HPBW=50″), are presented. Since the galaxies are all at the same distance, their relative CO contents are determined with no ambiguity—allowing a direct comparison of the masses of molecular gas over a range of Hubble types. The results indicate that the tical interaction of the galaxies has not greatly affected the star forming efficiency. (31 refs.)

74166 Observations of low redshift H I in Stephan's Quitent. J.W.Sulentic (Univ. of Alabama, University, AL, USA), H.Arp.
Astron. J. (USA), vol.88, no.3, p.267-71 (March 1983).
Neutral hydrogen measures that cover the velocity range from $V=200$ to 2200 km s^{-1} are reported for Stephan's Quitent and its immediate vicinity. All measures were obtained using a new very sensitive cooled GaAsFet receiver and the 305^m reflector at Arecibo. The observations indicate the existence of low redshift H I which is significantly displaced from the position of the low redshift optical component of the Quintet, NGC 7320. Analysis of previous measures of the Sd galaxy NGC 7320 show that it is strongly H I deficient for its type and also deficient in the fraction of its mass in the form of H I. Both results could be attributed to removal of H I from HGC 7320 by interaction, possibly with the high redshift members of the Quintet. This possibility justifies remeasurement of the H I around NGC 7320 with the highest sensitivity and resolution available. (14 refs.)

98.70 OTHER OBJECTS AND BACKGROUND RADIATIONS OF UNKNOWN ORIGIN AND DISTANCES

(for pulsars, see 97.60G)

98.70D Discrete radio sources

74167 Pressure collimation of supersonic radio jets. A.Krautter, R.N.Henriksen, K.Lake (Dept. of Phys., Queen's Univ. of Kingston, Kingston, Ontario, Canada).
Astrophys. J. (USA), vol.269, no.1, pt.1, p.81-93 (1 June 1983).
The transversely homologous steady state models of radio jets are treated as three-component mixtures (protons, electrons, and relativistic electrons). The jets may be both relativistically hot and macroscopically relativistic. The authors find a new fit for the main jet in NGC 315 with a model dominated by relativistic-electron pressure and demonstrate an alternative method for deducing the external equilibrium pressure requred to collimate a jet. This new method does not require an a priori parameterized pressure law to be assumed. The authors also discuss the maximum 'curvature' which a homologous, pressure-confined jet may have, and so deduce distinguishing behavior of macroscopically relativistic jets and of cold jets. (24 refs.)

74168 Rotation measures for compact variable radio sources. L.Rudnick, T.W.Jones (Dept. of Astron., Univ. of Minnesota, Minneapolis, MN, USA).
Astron. J. (USA), vol.88, no.4, p.518-26 (April 1983).
The authors have derived rotation measures for 31 compact variable extragalactic sources using Very Large Array observations at λ 18 cm and λ 20.5 cm. Polarization and total intensity data are presented for these and 29 additional soures at λ6 cm and λ 2 cm as well. Maps are also presented for sources with confusing extended structure. The calculated rotation measures are distributed similarly to those of extended sources, and do not appear to change over ~7 years (using data from Wardle 1977). The intrinsic polarization position angles of compact sources are shown to be similar over wide separations in wavelength. The authors briefly discuss the implications for the magnetic fields in and around compact sources. (10 refs.)

98.70J Quasars

74169 The ultraviolet excess of luminous quasars. II. Evidence for massive accretion disks. M.A.Malkan (Palomar Obs., California Inst. of Technol., Pasadena, CA, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.582-90 (15 May 1983).
For pt.I see ibid., vol.254, no.1, pt.1, p.22-37 (1982). Presents new infrared, optical, and ultraviolet spectra of three high-redshift quasars. They are analyzed along with three published quasar spectra. After accounting for other sources of radiation, the continua are fitted with spectra predicted for optically thick steady-state accretion disks which include the effects of general relativity. The two fitting parameters, the mass of the accreting black hole and the accretion rate, are determined by the data with a formal accuracy of 20%. (29 refs.)

74170 Reddening indicators for quasars and Seyfert 1 galaxies. S.A.Grandi (Dept. of Astron., Univ. of California, Los Angeles, CA, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.591-601 (15 May 1983).
Various techniques used to measure the dust reddening (exterior to the Milky Way) toward the broad line emission clouds of quasars and Seyfert 1 galaxies are critically analyzed. Detailed measurements of the UV and optical emission lines in the spectra of the bright Seyfert 1 galaxies Markarian 335 and 817 are presented. (66 refs.)

74171 On the association of galaxies and QSOs. H.B.French (Dept. of Phys. & Astron., Univ. of Oklahoma, Norman, OK, USA), J.E.Gunn.
Astrophys. J. (USA), vol.269, no.1, pt.1, p.29-34 (1 June 1983).
It is found from galaxy counts that there is a strong tendency for galaxies at about the plate limit of the 1.2 m Palomer Schmidt telescope to cluster about low-redshift QSOs. The signifiance of this clustering has been estimated in a nonparametric way using the Komogorov-Smirnov test and is found to be significant at the 99% level. If a power-law form for the galaxy-QSO cross-correlation function is assumed, the amplitude is the same within the errors to that of the galaxy-galaxy autocorrelation function. (26 refs.)

74172 Analysis of complete quasar samples to obtain parameters of luminosity and evolution functions. H.L.Marshall, Y.Avni, H.Tanabaum, G.Zamorani (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
Astrophys. J. (USA), vol.269, no.1, pt.1, p.35-41 (1 June 1983).
Presents a parametric likelihood analysis of the joint redshift-luminosity distribution for a composite, complete sample of 32 quasars with $17.0<B<19.2$ selected on the basis of ultraviolet excess. The authors determine best estimates and joint confidence regions for the parameters of several models of the quasar optical luminosity and evolution function. These models are also tested explicitly for their acceptability. The authors reject a model invoking pure density evolution on the basis of its extrapolation to fainter magnitudes through comparisons with the optical number counts and independently with the observed 2 keV X-ray background. The authors discuss the contribution of quasars to the X-ray background at 2 keV. (15 refs.)

74173 Optical and X-ray observations of faint quasars in an optically selected sample. H.L.Marshall, H.Tananbaum, G.Zamorani, J.P.Huchra (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA), A.Braccesi, V.Zitelli.
Astrophys. J. (USA), vol.269, no.1, pt.1, p.42-8 (1 June 1983).
Reports on spectroscopic and X-ray observations of quasar candidates in the 1.72 deg^2 region centered on $17^h.6°$, as selected by Formiggini et al (1980) on the basis of ultraviolet excess. The athors confirm six more quasars using spectroscopic data obtained with the MMT, producing a complete sample of 10 quasars having a limiting B magnitude of 19.20 The integral surface density of UV excess quasars at this magnitude is found. The authors complete the identification of quasar candidates with $B<18.25$ in the 37.2 deg^2 sample (from Braccesi, Formiggini, and Gandolfi, 1970) and find the surface density of quasars with $B<18.25$. X-ray data for these 10 quasars, from the Einstein Observatory, allow one to estimate the contribution of quasars with $B<19.20$ and $z<2.2$ to the cosmic 2 keV background. (24 refs.)

74174 Quasar evolution and gravitational collapse. A.Cavaliere (Istituto Astron., Univ. di Roma, Roma, Italy), E.Giallongo, A.Messina, F.Vagnetti.
Astrophys. J. (USA), vol.269, no.1, pt.1, p.57-72 (1 June 1983).
Presents three convergent results concerning the sources in the active nuclei of quasars and radio galaxies that derive their power from conversion of gravitational energy. The authors derive, for several leading models based on liberation of gravitational energy from mass in a compact supply, the laws governing the secular change $\dot{L}$ of the primary power driving the individual sources, and identify their common and key property. The authors describe a general statistical framework to populate with sources the (luminosity, cosmic time)-plane, based on a continuity equation that embodies a given $\dot{L}$. With $\dot{L}$ derived, the authors obtain basic evolutions of the density ($\dot{L}>0$) and of the luminosity ($\dot{L}<o$) type, with a global difference character. Finally, the authors compute the full evolution functions, comprising a brightening ($\dot{L}>0$) and a dimming ($\dot{L}<0$) phase, corresponding to three such models. (54 refs.)

74175 Spectroscopy of variable blue stellar objects. P.D.Usher, A.Warnock,III (Dept. of Astron., Pennsylvania State Univ., University Park, PA, USA), R.F.Green.
Astrophys. J. (USA), vol.269, no.1, pt.1, p.73-80 (1 June 1983).
Reports spectroscopic identifications of 23 ultraviolet-excess objects from three Palomar Schmidt fields at high galactic latitude centered on Kapteyn Selected Areas 57, 29, and 28. Twenty-one of the objects were selected on the basis of apparent optical variability; of these, 14 were found to be quasars, and one is a cataclysmic variable. The redshift distribution of high-amplitude variables is consistent with that predicted for the parent population but might suggest a higher likelihood for variability in higher luminosity objects. Evidence is presented in support of a conclusion, that between 7 and 11 quasars are variable with extremum amplitudes $\Delta B\geq0.5$ mag to $B=19$ mag over 22 deg^2 of sky, with a time coverage comprised of one archival Palomar Observatory Sky Survey plate and several contemporary plates. The discovery rate of quasars and variable stars will be greater for techniques with a high signal-to-noise ratio and sampling rate. The result suggests that most optically selected quasars are detectably variable. (30 refs.)

74176 Rectilinear motions in 3C 345. M.H.Cohen, S.C.Unwin, T.J.Pearson, G.A.Seielstad, R.S.Simon (Owens Valley Radio Obs., California Inst. of Technol., Pasadena, CA, USA), R.P.Linfield, R.C.Walker.
Astrophys. J. Lett. Ed. (USA), vol.269, no.1, pt.2, p.L1-4 (1 June 1983).
In 3C 345 a position angle coincidence between the elongation seen in 1971-1975 at 1-15 milli-arcsec from the core, and the outer component seen in 1978-1981 at 3.5-5 milli-arcsec, provides evidence for rectilinear motion. The inner component seen in 1978-1981 at 1-2 milli-arcsec is at a different

position angle. The observed curvature appears to be caused by a change in orientation of the nozzle, and not by components following a fixed curved path. The outer component seen in 1978-1981 is identified with the 1971-1975 western component, and this implies a linear acceleration in 1974-1976. (20 refs.)

74177 A new test of the cosmological interpretation of QSO redshifts. P.A.Shaver (European Southern Obs., Garching bei Munchen, Germany), J.G.Robertson.
Nature (GB), vol.303, no.5913, p.155-6 (12 May 1983).
Close QSO pairs can be used to test the cosmological interpretation of QSO redshifts. If (some of) the narrow absorption lines in QSO spectra arise in intervening matter, and if QSOs are surrounded by gaseous haloes or located in regions of high matter density (for example, clusters of galaxies), one may expect to find absorption in the spectrum of one QSO at the redshift of a foreground QSO which happens to be located nearby on the plane of the sky ('associated absorption'). According to the cosmological interpretation, the foreground QSO should have the lower redshift. If, on the other hand, QSO redshifts are unrelated to their distances, one would expect to find as many cases in which the foreground QSO has the higher redshift of the two; or if the absorption lines are not even due to intervening matter, there should be no coincidences of absorption and emission redshifts beyond random expectation. Thus, using associated absorption to distinguish which QSO of a pair is in front of the other provides a simple and straightforward test of the cosmological interpretation. (8 refs.)

74178 Discovery of DHM0054−284, a quasar of redshift 3.61. T.Shanks, R.Fong, B.J.Boyle (Dept. of Phys., Univ. of Durham, Durham, England).
Nature (GB), vol.303, no.5913, p.156-8 (12 May 1983).
The authors report the discovery of a quasar of redshift 3.61 detected in a broad band survey of stars using COSMOS measurements of UK Schmidt Telescope (UKST) photographs. The identification of the object as a quasar was confirmed by spectroscopic observations made with the Anglo-Australian Telescope (AAT). The quasar's redshift is the second highest so far detected and the highest for a quasar discovered using purely optical techniques. The authors describe the search for DHM0054−284 and suggest that the methods provide an efficient way of finding more high-redshift quasars. (9 refs.)

74179 Distribution of QSOs around NGC 1097. He Xiangtao, R.D.Wolstencroft (Royal Obs., Edinburgh, Scotland).
Sci. Sin. (China), vol.26, no.4, p.418-27 (April 1983).
The UK 1.2 m Shmidt telescope was used to obtain two objective-prism plates and one direct plate of the area around NGC 1097, centred on $2^h44.2^m-30°29.0'$ (1950.0) 37 quasar candidates are found within a 9 square degree region. Adding 6 QSOs found before, the total number of QSOs found in this area is 43. The authors have analysed the distribution of the QSOs around NGC 1097. The preliminary results are as follows: (i) The surface density of QSOs is very high near NGC 1097 and decreases with distance, from 15.2 to 2.0 per square degree. The average density is about 4.8 per square degree. (ii) There is an obvious correlation between the jets and the QSOs. (iii) It is difficult to explain the distribution of the QSOs by accidental probability or other reasons. This is good evidence to suggest that the redshifts are non-cosmological. (21 refs.)

98.70Q X-ray and gamma-ray sources

74180 The central X-ray source in RCW 103: evidence for blackbody emission. I.R.Tuohy (Mount Stromlo & Siding Spring Obs. Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia), G.P.Garmire, R.N.Manchester, M.A.Dopita.
Astrophys. J. (USA), vol.268, no.2, pt.1, p.778-81 (15 May 1983).
The authors present an improved position for the compact X-ray source in the center of the young supernova remnant RCW 103. Only one star brighter than $V\sim22$ mag lies inside the new error circle, but a spectroscopic study of the star rules out any relationship to the X-ray source. A sensitive search for radio pulsations from RCW 103 has proved equally unsuccessful. The absence of an optical or radio counterpart for the central X-ray source strengthens the likelihood that the object is a hot neutron star emitting blackbody radiation. This result is in accord with several theoretical calculations of neutron star cooling rates. (32 refs.)

74181 Stellar contributions to the hard X-ray galactic ridge. D.M.Worrall (Center for Astrophys. & Space Sci., Univ. of California, San Diego, CA, USA), F.E.Marshall.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.691-7 (15 April 1983).
Compares the number density of serendipitous sources in galactic plane Einstein Observatory IPC fields with predictions based on the intensity of the HEAO 1 A-2 unresolved hard X-ray galactic ridge emission. The authors conclude that theoretically predicted X-ray source populations of luminosity (8×10^{32})-(3×10^{34}) ergs s^{-1} have 2-10 keV local surface densities of less than $\sim8\times10^{-4}\ L_{32}{}^{-1}\ pc^{-2}$ and are unlikely to be the dominant contributors to the hard X-ray ridge. A new estimate for Be/neutron star binary systems, such as X Persei, which are in this luminosity range and were previously thought to be potentially large X-ray ridge contributors, gives a 2-10 keV local surface density of $\sim2.6\times10^{-5}\ L_{32}{}^{-1}\ pc^{-2}$. (30 refs.)

74182 Einstein observations of the rho Ophiuchi dark cloud. An X-ray Christmas tree. T.Montmerle, L.Koch-Miramond (Section d'Astrophys., CEN, Gif-sur-Yvette, France), J.E.Grindlay.
Astrophys. J. (USA), vol.269, no.1, pt.1, p.182-201 (1 June 1983).
An extensive guest observation of the ρ Ophiuchi dark cloud region was conducted with the Einstein Observatory, featuring in particular repeated observations of several parts of the cloud, on time scales down to a deay, or even hours. In all, 14 IPC and 3 HRI fields were obtained. Initially motivated by a search for a possible compact counterpart to the *COS B* γ-ray source 2CG 353+16 (for which no evidence was found), the present study gave a wealth of data, which turned out to be mostly relevant to early stages of stellar evolution. The authors interpret the time variability in terms of strong stellar flares, which dominate the X-ray luminosity of the sources. The authors discuss several implications bearing on early stages of stellar evolution and some consequences of the presence of X-ray active objects within dark clouds. Several comparisons are made with the Orion complex. Possible observational tests are suggested. (78 refs.)

98.70V Background radiations

74183 Solrad 11 observations of the far-ultraviolet background. C.S.Weller (Naval Res. Lab., Washington, DC, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.899-904 (15 May 1983).
Far-ultraviolet observations from the Solrad 11 satellite have established intensities of the 1220-1500 Å far-ultraviolet diffuse background of 180 and 280 photons $s^{-1}\ cm^{-2}\ sr^{-1}\ Å^{-1}$ near the north and south galactic poles, respectively. Compared with these intensities, other reported measurements range from near agreement to several times greater. This variation probably results from spurious effects on the diffuse background measurement such as airglow, energetic particles, and instrumental background. For the present measurements, however, no corrections for instrumental or atmospheric effects are required. Calculated direct starlight is a correction of ~25% to the total observed flux. Scattering from interstellar grains probably accounts for only a few percent of the diffuse background; estimates of the integrated background from distant galaxies and quasars indicate a contribution of ~10%. For the assumed case of emission by galactic halo neutrinos, an intensity upper limit of $\sim10^4$ photons $s^{-1}\ cm^{-2}\ sr^{-1}$ and a decay lifetime lower limit of 3×10^{24} s result. (44 refs.)

74184 The soft X-ray diffuse background. D.McCammon, D.N.Burrows, W.T.Sanders, W.L.Kraushaar (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA).
Astrophys. J. (USA), vol.269, no.1, pt.1, p.107-35 (1 June 1983).
Maps of the diffuse X-ray background intensity covering essentially the entire sky with ~7° spatial resolution are presented for seven energy bands: 130-188 eV (B band), 160-284 eV (C band), 440-930 eV (M_1 band), 600-1100 eV (M_2 band), 770-1500 eV (I band), 1100-2200 eV (J band), and 1800-6300 eV (2-6 keV band). The data were obtained on a series of 10 sounding rocket flights conducted over a 7-year period. The authors attempt to make the absolute intensities in these maps quantitatively accessible while still giving a clear qualitative display of the spatial features. (84 refs.)

98.80 COSMOLOGY

(for observational cosmology, see 98.70V; for origin and evolution of galaxy, see 98.50)

74185 Numerical solutions of high-frequency perturbations in Bianchi type IX models. R.J.Slagter (Univ. of Amsterdam, Amsterdam, Netherlands).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.513-26 (15 May 1983).
The problem in perturbation theory in general relativity is finding a natural gauge which simplifies the equations considerably. The first and second order perturbation equations in the 'Lorentz gauge' are solved using the two-timing method. The equations were deduced from the equations of Einstein in the presence of a matter energy-momentum tensor of a perfect fluid with equation of state $p=(\gamma-1)\rho$. It is found that the 0-0 component of the first order equations together with the gauge conditions are consistent with the Bianchi type V model, without axial symmetry. It represents a 'ground state' situation of the Bianchi type IX model (Mixmaster model). The second order equations, describing the reaction back of the gravitational waves on the slowly varying background, give rise to rotation and will disturb the isotropization mechanism. The numerical solutions show all the features which are expected to appear. Moreover, it is found that the frequency of the perturbations increases with γ. (20 refs.)

74186 Spherical simulations of holes and honeycombs in Friedmann universes. G.L.Hoffman, E.E.Salpeter, I.Wasserman (Center for Radiophys. & Space Res., Cornell Univ., Ithaca, NY, USA).
Astrophys. J. (USA), vol.268, no.2, pt.1, p.527-39 (15 May 1983).
Presents extensive parameter studies of spherically symmetric models (without dissipation) of the formation of voids in the galaxy distribution, for cosmological density parameter $\Omega\leq1$ in a standard cosmology. Deep holes can form only if Ω is near unity, and an isolated deep hole is always accompanied by a dense, thin surrounding spherical 'ridge.' If one starts with underdensities at the cell centers of a regular lattice array, similarly deep holes and similar surrounding dense ridges (mimicking a honeycomb structure) form even in the absence of dissipation. The converse does not occur, i.e. a lattice array with overdensities at the cell centers forms dense clusters but no deep holes between the cells. The density contrasts at recombination required to form the observed holes and rich clusters are quite large, and smearing by radiative diffusion does not reduce the associated cosmic microwave background temperature fluctuations to the level required by the present observed upper limits to the small-scale anisotropy. The predicted anisotropy is non-Gaussian, giving the appearance of discrete sources of size ~10′. This discrepancy is particularly severe if Ω is small. Models with massive neutrinos and $\Omega\approx1$ are discussed, as are other possible resolutions to the dilemma. (53 refs.)

74187 Viscous cosmological models with matter and radiation. M.Szydlowski (Dept. of Philosophy, Pontifical Acad. of Cracow, Cracow, Poland), M.Heller.

Acta Phys. Pol. B (Poland), vol.B14, no.4, p.303-6 (April 1983).

Robertson-Walker world models filled with interacting matter and radiation, including the bulk viscosity dissipation, are constructed. It is shown that there exist stationary solutions in which the bulk viscosity term can be interpreted as phenomenologically describing a creation of matter and radiation. (12 refs.)

74188 The influences of massive neutrinos on clustering in the early Universe. Fang Li-zhi (Univ. of Sci. and Technol. of China, China), Liu Yong-zhen.

Commun. Theor. Phys. (China), vol.1, no.1, p.77-85 (1982).

The influence of massive neutrinos upon the clustering processes of cosmological matter in the early Jeans instability stage has been studied in the standard big bang theory. (7 refs.)

74189 Some inhomogeneous viscous fluid cosmological models of plane symmetry. S.R.Roy, O.P.Tiwari (Dept. of Math., Banaras Hindu Univ., Varanasi, India).

Indian J. Pure & Appl. Math., vol.14, no.2, p.233-43 (Feb. 1983).

Some plane symmetric solutions representing inhomogeneous cosmological models with viscous fluid distributions have been obtained. Special cases of perfect fluid distributions have been considered. (7 refs.)

74190 The renormalized coupling constant in an open static Einstein universe. Jia-Zhu Wang (Internat. School for Advanced Studies, Trieste, Italy).

Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.18, p.614-18 (30 April 1983).

The quartic self-coupling constant in an open static Einstein universe is investigated. The temperature and curvature effects to the coupling constant are discussed through the one-loop renormalized effective potential. (4 refs.)

74191 A scalar field with self-interaction leads to the absence of a singularity in cosmology. V.N.Melnikov, S.V.Orlov (State Committee for Stand., Moscow, USSR).

Phys. Lett. A (Netherlands), vol.95A, no.5, p.226-9 (2 May 1983).

A self-consistent treatment of the Higgs conformal field with spontaneously broken symmetry and gravitational field in the semiclassical approximation is shown (by computer calculation) to lead to the absence of a singularity in the anisotropic model if the domain structure is taken into account. (14 refs.)

74192 Time limit for hadronic phase transition in the big bang. J.Lodenquai, V.Dixit (Dept. of Phys., Univ. of the West Indies, Kingston, Jamaica).

Phys. Lett. B (Netherlands), vol.124B, no.5, p.317-20 (5 May 1983).

The evolution of the Robertson-Walker scale factor $R(t)$ during a first order phase transition from a quark-gluon plasma phase to a hadronic phase is investigated. In the $k=0$ case $R(t)$ is found to be oscillatory, a behaviour which sets an upper limit Δt_m to the time allowed for estimates of the actual transition time. Furthermore, Δt_m and the transition time are found to be fairly insensitive to the quark-gluon equation of state at a given transition temperature. (7 refs.)

74193 Could the metastable vacuum burn. V.A.Berezin, V.A.Kuzmin, I.I.Tkachev (Inst. for Nuclear Res. of the Acad. of Sci., Moscow, USSR).

Phys. Lett. B (Netherlands), vol.124B, no.6, p.479-83 (12 May 1983).

The equations of motion of an interface between two phases with an arbitrary equation of state are obtained. It is found that the process of vacuum burning can take place. It is shown that under certain conditions the process of the expansion of new phase bubbles is described by the equations of detonation waves. Possible cosmological consequences of the metastable phase burning effect are briefly discussed. (18 refs.)

74194 Formation of structure in an axion-dominated Universe. M.S.Turner (Astron. & Astrophys. Center, Univ. of Chicago, Chicago, IL, USA), F.Wilczek, A.Zee.

Phys. Lett. B (Netherlands), vol.125B, no.1, p.35-40 (19 May 1983).

The authors consider the formation of structure in a Universe dominated by axions of mass $\approx 10^{-5}$ eV ($f_{\mathrm{a}} \approx 10^{12}$ GeV). Because of their high phase space density and very low temperature, it is not difficult for axions to find their way into galactic haloes. With a suitable initial spectrum of density fluctuations, the present observed structure of the Universe could have evolved. However, the Zel'dovich spectrum, which is predicted by some inflationary Universe scenarios, is difficult to accommodate. (24 refs.)

74195 Inflationary universe with gravity. E.Mottola (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA), A.Lapedes.

Phys. Rev. D (USA), vol.27, no.10, p.2285-93 (15 May 1983).

The original idea of the inflationary universe is shown to be consistent with observation, if the effects of spacetime curvature are considered. Specifically, a combined grand-unified-gravitational tunneling solution exists, which is homogeneous over the entire spatial section and has lower action than the flat-space, inhomogeneous bubble. Thus, the exit from the metastable de Sitter phase can occur gracefully, without generating large spatial inhomogeneities or magnetic monopoles. The large expansion factor is generated naturally by the tunneling amplitude and does not require fine tuning the initial conditions of the post-tunneling evolution. Fluctuations in this model may differ substantially from the roll-over picture. (24 refs.)

74196 Fluctuations in the homogeneous inflationary Universe. E.Mottola (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).

Phys. Rev. D (USA), vol.27, no.10, p.2294-8 (15 May 1983).

Quantum fluctuations in the homogeneous inflationary Universe are shown to give rise to inhomogeneities of the right spectrum and magnitude needed to form galaxies. (15 refs.)

74197 Vacuum energy and large-scale structure of the Universe. V.F.Mukhanov, G.V.Chibisov (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).

Sov. Phys.-JETP (USA), vol.56, no.2, p.258-65 (Aug. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.2, p.475-87 (Aug. 1982). [received: May 1983]

Small longitudinal quantum fluctuations of the metric in cosmological models with metastable vacuum are considered. A Hamiltonian formalism is constructed and the system of small perturbations quantized. The single-loop corrections are taken into account in the Einstein equations. The stability of the models with respect to perturbations of the metric is investigated. The spectrum of fluctuations of the metric is calculated. Under certain conditions, the amplitude of the spectrum is sufficient for the formation of galaxies during the hydrodynamic stage after the decay of the polarized vacuum. (19 refs.)

BIBLIOGRAPHY INDEX

^{13}C NMR chemical shift tensors of metal carbonyls, (58 refs.) 72690
Adsorption and reactions of CO, NO, H$_2$ and O$_2$ on group VIII metal surfaces, (111 refs.) 73369
Alkali metal chloride aqueous solutions, thermodynamic properties, (77 refs.) 73359
Application of differential reflectometry, (88 refs.) 70108
Auger electron spectroscopy, (51 refs.) 72897
Binary stars, (163 refs.) 74116
Coiolis intensity perturbations of the ν_4 band of SF$_6$, (50 refs.) 70838
Compact toroid confinement and stability, (51 refs.) 71780
Computer modelling of amorphous magnetic materials, (107 refs.) 71881
Convection in melt growth, (76 refs.) 71915
Cosserat continuum theory applied to bone, (52 refs.) 73625
Creep, crack and cavity nucleation, (83 refs.) 73145
Creep, grain boundary sliding, (55 refs.) 73197
Creep strength, high temperature, (53 refs.) 73148
Crystal growth of refractory compounds from solutions in metallic melts, (175 refs.) 72979
Dielectric-semiconductor structures, (93 refs.) 72507
Dose-rate effects in mammalian cells. IV. Repairable and nonrepairable damage in noncycling C3H 10T$^1/_2$ cells, (69 refs.) 73640
Drag reduction and mechanical degradation in polymer solutions in flow, (57 refs.) 71608
Dynamics of surface atoms and molecules under irradiation, (58 refs.) ... 72227
Earthquake prediction, (136 refs.) 73739
Electromechanical and physicochemical properties of connective tissue, (260 refs.) 73624
Electron beam blanking systems, (36 refs.) 70156
Film models for multicomponent mass transfer, (49 refs.) 70020
Galactic distance scales, (87 refs.) 74138
Galaxy collisions, (82 refs.) 74160
Gem materials, natural and artificial, (137 refs.) 73793
Grain-boundary diffusion in metals, (130 refs.) 72170
Growth of dislocation-free bulk silicon crystals, (81 refs.) 72982
H cracking in Zr and alloys, (143 refs.) 73176
Heavy-ion atomic physics. The decay of the vacuum and intermediate molecules, (156 refs.) 70581
Heavy ions as nuclear probes, (333 refs.) 70743
HH 1, HH 2 and Cohen-Schwartz star, (66 refs.) 74067
II-V semiconductor epitaxial layers characterisation, (140 refs.) 72267
In-beam gamma-ray spectroscopy with heavy ions, (202 refs.) 70742
Interactive dynamical processes at surfaces, models, (132 refs.) 73366
Internal variables and the thermodynamics of macromolecule solutions, (62 refs.) 71607
Ion deposition of thin films, microelectronics appls, (51 refs.) 72999
Ion etching and its applicability in medicine, (73 refs.) 73241
Ion-implantation associated defect production in silicon, (58 refs.) 71996
Ion sputtering physics, (101 refs.) 72916
Ionic crystal surface vibration spectroscopy by inelastic scattering of atoms, (51 refs.) 72209
Ionisation potentials calculations, (69 refs.) 70773
Isolated ion hyperfine interactions, (110 refs.) 70582
Isostatic pressing technology for refractory materials, (44 refs.) 73046
Kronecker products for compact semisimple Lie groups, (56 refs.) 70252
Laser-plasma interactions, (83 refs.) 71744
Liquid alloys, volume of mixing, (62 refs.) 72127
LWR containment vessel design and practice, (164 refs.) 70717
Magnetic field line reconnection experiments, (60 refs.) 71699
Magnetic mirrors, (77 refs.) 71785
Mars surface features, (88 refs.) 74025
Mars, Tharsis region evolution, (109 refs.) 74012
Martian outflow channels, (59 refs.) 74026
Melting, order, flows, mappings and chaos, (71 refs.) 72087
Minority carrier recombination in heavily doped Si, (86 refs.) 72415
Mirror confinement physics;, (59 refs.) 71786
Narrow lines in gamma Cassiopeiae, (56 refs.) 74072
Ni and Ni-Cr alloys, embrittlement, (64 refs.) 73198
Nonstoichiometry of inorganic solids, (50 refs.) 71955
Nuclear test ban treaty, seismic verification, (87 refs.) 73733
Nuclear test band treaty verification, (104 refs.) 73730
Orbital period changes in Centaurus X-3, (62 refs.) 74104
Oriented crystallisation on amorphous substrates;, (118 refs.) 72283
Pacinian channels, vibrotactile masking, (51 refs.) 73609
Partial coherence bibliography 1976-1980, (216 refs.) 69811
Peristaltic transport of a physiological fuid, (54 refs.) 73614
Phonons in amorphous materials, (51 refs.) 72070
Picosecond streak camera fluorometry, (155 refs.) 70117
Prosthetic heart valve replacements, (180 refs.) 73684
Pu in hydrosphere, (147 refs.) 73488
Quasars reddening indicators, (66 refs.) 74170
Radiation biology: the conceptual and practical impact on radiation therapy, (112 refs.) 73636
Rapid solidification growth kinetics, (60 refs.) 72088
Rapid solidification of metastable materials, (102 refs.) 73078
Resonance integrals for neutron capture and fission on $1\leq Z\leq$nuclei, (439 refs.) 69798
Reversed-field pinch, (123 refs.) 71787
SbSI and other ferroelectric A^{V}B^{VI}C^{VII} materials, (324 refs.) 72739
Scanning Auger microscopy, (79 refs.) 73309
Schwinger model, (77 refs.) 70166
Sea level changes, (58 refs.) 73805
Seismic body wave attenuation, (140 refs.) 73732
Seismic event type discrimination, (83 refs.) 73729
Self-diffusivity of gases and liquids, (94 refs.) 71677
Semiconductor interfaces, microscopic investigations, (84 refs.) 72487
Sliding wear of copper and copper alloys, (50 refs.) 73233
Spectroscopy of high-temperature metal halide vapour complexes, (180 refs.) 70847
Spectroscopy of molecular crystals, (1107 refs.) 69810
Star-burst galactic nuclei, (88 refs.) 74141
Steels, transformations, solute-drag considerations, (58 refs.) 73081
Stellar winds and molecular clouds: T Tauri stars, (56 refs.) 74127
Stellarators, (62 refs.) 71784
Studies of isolated GeH stretching frequencies. I. Data, assignments and effects of conformation, (53 refs.) 70876
Superconductivity in metal systems: MO calculations, (115 refs.) 72540
Temperature gradient zone melting, (52 refs.) 72986
Thermal aspects of radioactive waste burial in hard rock, (154 refs.) 70651
Thermal conductivity of pure fluids and mixtures, (84 refs.) 71681
Three dimensional theory of inelastic stability, (188 refs.) 71417
Tokamak devices;, (263 refs.) 71783
Type I supernova models, (57 refs.) 74092
Underground nuclear explosion yield estimation, (134 refs.) 73731
US policy analysis liquid fuel supply model, (60 refs.) 73396
Vacuum arc cathodes theory, (108 refs.) 71816
Violin research history, (193 refs.) 69849

BOOK INDEX

Batteries and energy systems. 2nd edition; C.L.Mantell, [New York, USA: McGraw-Hill 1983] 73429

Current topics in materials science. Vol.10; *E.Kaldis (editor/s),* [Amsterdam, Netherlands: North-Holland 1982] 69797 (introductory abstract), 70847, 71955, 72283, 72739, 73793

Evolution of the Earth; *R.J.O'Connell, W.S.Fyfe (editor/s),* [Washington, DC, USA: American Geophysical Union 1981] 69784 (introductory abstract), 73722, 73749, 73766–72, 73778–81, 73916

Evolution of the Universe; I.D.Novikov, *M.M.Basko (translator/s),* [Cambridge, England: Cambridge 1983] 69809

Formulas, facts and constants. For students and professionals in engineering, chemistry and physics; H.J.Fischbeck, K.H.Fischbeck, [Berlin, Germany: Springer-Verlag 1982] 69803

Fusion. Vol.1. Magnetic confinement. Part A; *E.Teller (editor/s),* [London, England: Academic Press 1981] 69800 (introductory abstract), 71730–1, 71783–7

Heavy ion collisions. Vol.3; *R.Bock (editor/s),* [Amsterdam, Netherlands: North-Holland 1982] 69804 (introductory abstract), 70581–2, 70742–3

Introduction to atomic and molecular collisions; R.E.Johnson, [New York, USA: Plenum 1982] 69801

Laser processing and analysis of materials; W.W.Duley, [New York, USA: Plenum 1983] 69807

Masers and lasers. An historical approach; M.Bertolotti, [Bristol, England: Adam Hilger 1983] 69805

Physics of the Jovian magnetosphere; *A.J.Dressler (editor/s),* [Cambridge, England: Cambridge 1983] 69806

Similarities in physics; J.N.Shive, R.L.Weber, [Bristol, England: Adam Hilger 1982] 69808

Tectonic and geologic evolution of southeast asian seas and islands. Pt.2; D.E.Hayes, [Washington, DC, USA: American Geophysical Union 1983] 69796

Vibrational intensities in infrared and Raman spectroscopy; *W.B.Person, G.Zerbi (editor/s),* [Amsterdam, Netherlands: Elsevier 1982] 69802

CONFERENCE INDEX

Annual Meeting of the Seismological Society of America; Anaheim, CA, USA, 19-21 April 1982, [Dec. 1982] 69776 (introductory abstract), 69855, 73727–40, 73928–31

Antennas and propagation; Norwich, England, 12-15 April 1983, [London, England: IEE 1983] 73653–4, 73903–4, 73994–5

Atmospheric chemistry, role of the oceans; Hamburg, Germany, 24-27 Aug. 1982, [20 Oct. 1982] 69777 (introductory abstract), 73839–40, 73868–81

Atmospheric turbulence and air pollution modelling; The Hague, Netherlands, 21-25 Sept. 1981, *F.T.M.Nieuwstadt, H.Van Dop (editor/s),* [Dordrecht, Netherlands: Reidel 1982] 69793 (introductory abstract),

Biorheology, 1981; Tokyo, Japan, 27 July-1 Aug. 1981, [1983] 73517, 73618–21

Chemistry of materials at high temperatures; Harwell, Oxon., England, 7-10 Sept. 1981, [1982] 72075–6, 72092–5, 72118, 72136–7, 72165, 72994, 73267

Chemistry of the unpolluted and polluted troposphere; Corfu, Greece, 28 Sept.-10 Oct. 1981, *H.W.Georgii, W.Jaeschke (editor/s),* [Dordrecht, Netherlands: Reidel 1982] 69791 (introductory abstract),

Deposition of atmospheric pollutants; Oberursel/Taunus, Germany, 9-11 Nov. 1981, *H.-W.Georgii, J.Pankrath (editor/s),* [Dordrecht, Netherlands: Reidel 1982] 69792 (introductory abstract),

Electrical contacts; Chicago, IL, USA, 13-15 Sept. 1982, [March 1983] 71257, 72195

Electrostatics 83; Oxford, England, 13-15 April 1983, *(IOP) S.Singh (editor/s),* [Bristol, England: IOP 1983] 69787 (introductory abstract), 70086–7, 70755, 71052–5, 71513, 71662, 71832–6, 72479, 72736, 73378–9

Emission electronics; Moscow, USSR, Dec. 1981, [1982] 69775 (introductory abstract), 71810, 71919, 72194, 72214–21, 72459–60, 72472–5, 72495, 72600, 72632, 72873, 72889, 72899–902, 72904, 72907, 72934–6, 72939–43, 72969–72, 73133, 73382

Fracture and NDT in reactor materials; Stuttgart, Germany, 14-15 Oct. 1982, [Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982] 70645–7, 70688–97, 73216–17, 73286

High energy physics, 1982; Mysore, India, 6-11 Dec. 1982, [Bombay, India: Dept. Atomic Energy 1982] 69936, 69958, 70234–40, 70293–7, 70308, 70325–6, 70338–9, 70376, 70379–80, 70401–2, 70422

High resolution electron microscopy; London, England, 12-16 July 1982, [March 1983] 69778 (introductory abstract), 70154, 71843–6, 71954, 71965, 71974, 71980–2, 73083

Incorporating microprocessor technology into control systems; London, England, 25 March 1983, [London, England: IEE 1983] 70721

Information and system theory; Garmisch-Partenkirchen, Germany, 23-25 March 1983, [1983] 71081–2

Large scale integration; Baden-Baden, Germany, 7-9 March 1983, [1983] 73390

Melting, localisation and chaos; Argonne, IL, USA, 2-3 Nov. 1981, *R.K.Kalia, P.Vashishta (editor/s),* [New York, USA: North-Holland 1982] 69788 (introductory abstract), 70002, 70025, 70233, 71104, 71518, 71558, 71862, 71978, 72085–7, 72104, 72252, 72295, 72309, 72341

Microdosimetry; Julich, Germany, 27 Sept.-1 Oct. 1982, *J.Booz, H.G.Ebert (editor/s),* [Luxembourg: Comm. European Communities 1982] 73669 (introductory abstract),

New tools for industrial processes; London, England, 14 April 1983, [London, England: IEE 1983] 71808, 73343

Nonresonant interaction of optical radiation with matter; Leningrad, USSR, 1-4 Dec. 1981, [1982] 69774 (introductory abstract), 71159–61, 71174, 71208, 71601, 71735, 71757–9, 72007–12, 72256, 72845, 72878, 73254–5, 73335, 73344–5

Nuclear reactor thermal hydraulics; Santa Barbara, CA, USA, 11-14 Jan. 1983, *(ANS; ASME; AIChE) M.Merilo (editor/s),* [LaGrange Park, IL, USA: ANS 1982] 70714

Nuclear spectroscopy and the structure of the atomic nucleus, 1981; Samarkand, USSR, April 1981, [1982] 70426–9, 70481–3, 70500–2, 70508, 70523, 70525, 70530–2, 70546–7, 70564, 70826

Nuclear spectroscopy and the structure of the atomic nucleus, 1981; Samarkand, USSR, April 1981, [1982] 70484

Nuclear waste management; Boston, MA, USA, 16-19 Nov. 1981, *S.V.Topp (editor/s),* [New York, USA: North-Holland 1982] 69789 (introductory abstract), 70698–705

Nucleus-nucleus collisions; East Lansing, MI, USA, 26 Sept.-1 Oct. 1982, *(U.S. Dept. Energy.; NSF; IUPAC; et al)* [East Lansing, MI, USA: Michigan State Univ. 1982] 69785 (introductory abstract), 70440–5, 70455–7, 70465, 70471, 70513–22, 70529, 70535–8, 70561–3, 70583–624, 70636, 70642, 70744, 70753, 71030

Optical detection of magnetic resonances in solids; Leningrad, USSR, 6-8 April 1981, [1982] 69773 (introductory abstract), 72430, 72579, 72672, 72699–709, 72713–15, 72817, 72843–4

Optical fibre sensors, 1983; London, England, 26-28 April 1983, [London, England: IEE 1983] 69795 (introductory abstract), 71221, 71242–51, 73655

Phoenix conference on computers and communications, '83; Phoenix, AZ, USA, 14-16 March 1983, *(IEEE)* [New York, USA: IEEE 1983] 73993

Photovoltaic solar energy; Stresa, Italy, 10-14 May 1982, *W.H.Bloss, G.Grassi (editor/s),* [Dordrecht, Netherlands: Reidel 1982] 73456–64

Photovoltaic specialists conference; San Diego, CA, USA, 27-30 Sept. 1982, [New York, USA: IEEE 1982] 72983–4, 73093, 73426–7, 73440–55

Physics of non crystalline solids; Montpellier, France, 5-9 July 1982, *(Int. Comm. Glass; Societe Francaise de Physique)* [Dec. 1982] 71380, 71882, 71897, 71913, 72046, 72057–62, 72070–2, 72545–6, 72575, 72821–2

Physics of semiconductors; Montpellier, France, 6-10 Sept. 1982, *(IUPAP; Societe Francaise de Physique; European Phys. Soc)* [March 1983] 69780 (introductory abstract), 71126, 71983, 72291, 72305–7, 72315–25, 72329, 72340, 72346–8, 72357, 72363, 72398, 72434–6, 72496, 72722, 72754–5, 72804–7, 72824–5, 72830–2, 72836, 72842, 72860–3, 72949–51

Plasma physics; Goteborg, Sweden, 9-15 June 1982, [1982] 70724–5, 71699–701, 71711, 71729, 71733–4, 71744, 71749, 71752–3, 71756, 71775–82, 71799–800

Polyblends; Montreal, Canada, 20 April 1982, *(Nat. Res. Council Canada)* [mid-Dec. 1982] 69781 (introductory abstract), 72125, 73206

Precision electromagnetic measurements, 1982; Boulder, CO, USA, 28 June-1 July 1982, *(NBS; IEEE; URSI)* [1982] 70029, 70035–41, 70075–80, 70089, 70095, 71162

Radioactive waste conditioning for storage and disposal; Utrecht, Netherlands, 21-25 June 1982, [Vienna, Austria: IAEA 1983] 69786 (introductory abstract), 70654–87

Rapidly solidified amorphous and crystalline alloys; Boston, MA, USA, Nov. 1981, *B.H.Kear, B.C.Giessen, M.Cohen (editor/s),* [New York, USA: North-Holland 1982] 69790 (introductory abstract), 71847, 71865, 71905, 72079, 72088–91, 72112, 72128, 72131, 72296, 73023–4, 73032–3, 73035–6, 73077–9, 73094, 73118

Role of trace elements and interfaces in creep failure; Dallas, TX, USA, 14-18 Feb. 1982, *(Mech. Metall. Committee of TMS-AIME)* [April 1983] 69779 (introductory abstract), 73144–9, 73197–8

Science underground; Los Alamos, CA, USA, 1982, [1982] 69846, 69949, 69970–2, 70269–70, 70493–9, 70745, 73704, 73961, 73964, 73997, 74063

Sea level ice and climatic change; Canberra, Australia, Dec. 1979, *(Int. Assoc. Hydrological Sci.; et al) I.Allison (editor/s),* [Washington, DC, USA: Int. Assoc. Hydrological Sci. 1981] 69794 (introductory abstract),

Semiconductor International '82; England, 1982, [Luton, Beds., England: Benn Electronics Publications 1982] 72985

Sintering, theory and practice; Portoroz, Yugoslavia, 7-10 Sept. 1981, *D.Kolar, S.Pejovnik, M.M.Ristic (editor/s),* [Amsterdam, Netherlands: Elsevier 1982] 72973, 73021–2, 73031, 73050–2, 73057

Solid-state circuits; New York, USA, 23-25 Feb. 1983, *L.Winner (editor/s),* [New York, USA: IEEE 1983] 70062

Sound broadcasting; Mannheim, Germany, 23-25 Nov. 1982, [1983] 70084, 71314, 73628

SOUTHEASTCON '83; Orlando, FL, USA, 11-14 April 1983, [New York, USA: IEEE 1983] 72648, 72775

Surface science; Gent, Belgium, 24-27 Aug. 1982, [March 1983] 69782 (introductory abstract), 71841, 72126, 72197–202, 72208–9, 72233–43, 72274, 72465–7, 72644, 72894–5, 72919–25, 72957–60, 73369–70

Synchrotron radiation users group conference, 1982; Stoughton, WI, USA, 18-19 Oct. 1982, [Stoughton, WI, USA: Synchrotron Radiat. Center 1982] 70733–6, 70832, 70944, 70952–3, 72251, 72964–8, 73371

Theoretical chemistry 1982; Alghero, Sardinia, 5-8 Oct. 1982, [May 1983] 70760, 70777, 70781, 70784–5, 70928, 70965–6, 70992, 71848, 72212, 73314–19, 73357

Vacuum physics and thin films; Brunn am Gebirge, Austria, 27-29 Oct. 1981, [Jan.-Feb. 1983] 69783 (introductory abstract), 70071, 70143–4, 70150, 71025, 71657, 71997, 72278–82, 72761, 72890–3, 72898, 72932–3, 72963, 72993, 73393

CORPORATE AUTHOR INDEX

Atomic Energy Canada Ltd., Chalk River, Ont.
  Bound coherent and incoherent thermal neutron scattering cross sections of the elements, AECL-7980. 69799
  Dose conversion factors for intakes of selected radionuclides by infants and adults, AECL-7919. 70731
  Transient fission product release during dryout in operating UO_2 fuel, AECL-7832. 70720
  ZED-2 experiments on the effect of a Co absorber rod on an NRU loop, AECL-7515. 70713
Comm. European Communities, Luxembourg
  Depot de couches polycristallines de silicium sur un substrat conducteur a partir de la phase liquide (Deposition of polycrystalline Si films on conducting substrates from the liquid phase), EUR 8305 FR. 73016
  Etude de faisabilite d'une centrale photovoltaique de taille moyenne (0,5 - 1 MW), avec stockage (Feasibility study for a medium-sized (0.5 - 1.0 MW) photovoltaic power station, with storage), EUR 8196 FR. 73425
  Faisabilite technique et economique de la geothermie basse energie en Europe (Technical and economic feasibility of deep geothermal energy in Europe. Annexes), EUR 8241/II FR. 73408
  Nouvelles methodes de preparation de materiau semi-conducteur cellules solaires Cu_2S-CdS (New methods for the production of the solar cell semi-conductor material Cu_2S-CdS), EUR 8210 FR. 73439
  Recrystallization of amorphous and small grain size polycrystalline silicon, EUR 8197 EN. 72998
Ist. Naz. Fis. Nucl., Pisa, Italy
  Further improvements in the design of a positron camera with dense drift space MWPC's, INFN/TC-83/5. 70752
Nat. Phys. Lab., Teddington, England
  Recommended procedure for micro-indentation Vickers hardness test, NPL-MOM-62. 73311

CUMULATIVE INDEXES

Cumulative indexes are available for *Physics Abstracts*, *Electrical & Electronics Abstracts* and *Computer & Control Abstracts*, for both authors and subjects. These cumulations generally cover a period of four years, with the exception of *Computer & Control Abstracts* where the initial volume covered the period 1966–68. The table below shows the prices and periods for the two types of cumulative index.

	PHYSICS ABSTRACTS		ELECTRICAL & ELECTRONICS ABSTRACTS		COMPUTER & CONTROL ABSTRACTS	
	Subject	Author	Subject	Author	Subject	Author
	£	£	£	£	£	£
1955-59	20	20	15	20	—	—
1960-64	40	17	20	12	—	—
1965-68	60	25	35	20	—	—
1969-72	—	—	72	64	48	30
1973-76	600	300	250	150	150	75
1977-80	770	450	380	250	250	120
1966-68	—	—	—	—	15

ORDERING PROCEDURE

THE AMERICAS
North (including Canada), Central and South

All orders from the above areas, and orders from members of Institute of Electrical and Electronics Engineers Inc. anywhere in the world, should be sent to Fulfillment Manager, Institute of Electrical & Electronics Engineers Inc., 445 Hoes Lane, Piscataway, N.J. 08854, USA. Telephone (201) 981 0060

日本のお客様にご案内申し上げます

日本国内に於けるINSPECの購入価格はすべて円建てとなっております　また刊行物はすべて航空便で配達されます　INSPEC刊行物の価格、その他についてのお問合わせは最寄の洋書取扱専門店または輸入総代理店㈱ユー・エス・エンアテック　カンパニー　〒105東京都港区新橋1　13　12、TEL 03 (502) 6471までご連絡ください

REMAINDER OF THE WORLD

All remaining subscriptions should be sent to INSPEC Marketing Department, P O Box 26, Hitchin, Herts SG5 7RS, England. Telephone Hitchin 53331, Telex 825962, Telegrams IEE G.

OTHER INSPEC SERVICES

SDI

(Selective Dissemination of Information.) This is a service individually tailored to the requirements and interests of the engineer or research worker. Details of information relevant to the interest profile of the individual subscriber are selected from the data being processed for the INSPEC database. Information is dispatched weekly on 150 mm × 100 mm (6″ × 4″) cards.

TOPICS

This is an SDI service based on standard profiles. There are over 70 subjects covering high-activity areas of research and development. This is an inexpensive card service designed to alert engineers and researchers to the availability of literature within their subject area.

MAGNETIC TAPES

Tapes containing all the information included in the INSPEC publications are issued twice monthly. They enable the larger research and development organisations to produce their own internal information and current-awareness services.

Summary Classification

The full classification and contents are given at the front of the journal, followed by an **Alphabetical Index** to the subjects covered

00.00 **General**

01.00 Communication, Education, History and Philisophy
02.00 Mathematical Methods in Physics
03.00 Classical and Quantum Physics; Mechanics and Fields
04.00 Relativity and Gravitation
05.00 Statistical Physics and Thermodynamics
06.00 Measurement Science, General Laboratory Techniques, and Instrumentation Systems
07.00 Specific Instrumentation and Techniques of General Use in Physics

10.00 **The Physics of Elementary Particles and Fields**

11.00 General Theory of Fields and Particles
12.00 Specific Theories and Interaction Models; Particle Systematics
13.00 Specific Reactions and Phenomenology
14.00 Properties of Specific Particles and Resonances

20.00 **Nuclear Physics**

21.00 Nuclear Structure
23.00 Radioactivity and Electromagmetic Transitions
24.00 Nuclear Reactions and Scattering: General
25.00 Nuclear Reactions and Scattering: Specific Reactions
27.00 Properties of Specific Nuclei listed by Mass Ranges
28.00 Nuclear Engineering and Nuclear Power Studies
29.00 Experimental Methods and Instrumentation for Elementary-Particle and Nuclear Physics

30.00 **Atomic and Molecular Physics**

31.00 Theory of Atoms and Molecules
32.00 Atomic Spectra and Interactions with Photons
33.00 Molecular Spectra and Interactions with Photons
34.00 Atomic and Molecular Collision Processes and Interactions
35.00 Properties of Atoms and Molecules; Instruments and Techniques
36.00 Studies of Special Atoms and Molecules

40.00 **Classical Areas of Phenomenology**

41.00 Electricity and Magnetism; Fields and Charged Particles
42.00 Optics
43.00 Acoustics
44.00 Heat Flow, Thermal and Thermodynamic Processes
46.00 Mechanics, Elasticity, Rheology
47.00 Fluid Dynamics

50.00 **Fluids, Plasmas and Electric Discharges**

51.00 Kinetic and Transport Theory of Fluids; Physical Properties of Gases
52.00 The Physics of Plasmas and Electric Discharges

60.00 **Condensed Matter: Structure, Thermal and Mechanical Properties**

61.00 Structure of Liquids and Solids; Crystallography
62.00 Mechanical and Acoustic Properties of Condensed Matter
63.00 Lattice Dynamics and Crystal Statistics
64.00 Equations of State, Phase Equilibria, and Phase Transitions
65.00 Thermal Properties of Condensed Matter
66.00 Transport Properties of Condensed Matter (Nonelectronic)
67.00 Quantum Fluids and Solids; Liquid and Solid Helium
68.00 Surfaces and Interfaces; Thin Films and Whiskers

70.00 **Condensed Matter: Electronic Structure, Electrica Magnetic, and Optical Properties**

71.00 Electron States
72.00 Electronic Transport in Condensed Matter
73.00 Electronic Structure and Electrical Properties of Surfaces, Interfaces, and Thin Films
74.00 Superconductivity
75.00 Magnetic Properties and Materials
76.00 Magnetic Resonances and Relaxation in Condensed Matter; Mossbauer Effect
77.00 Dielectric Properties and Materials
78.00 Optical Properties and Condensed Matter Spectroscopy and other Interactions of Matter with Particles and Radiation
79.00 Electron and Ion Emission by Liquids and Solids; Impact Phenomena

80.00 **Cross-Disciplinary Physics and Related Areas of Science and Technology**

81.00 Materials Science
82.00 Physical Chemistry
86.00 Energy Research and Environmental Science
87.00 Biophysics, Medical Physics, and Biomedical Engineering

90.00 **Geophysics, Astronomy and Astrophysics**

91.00 Solid Earth Geophysics
92.00 Hydrospheric and Atmospheric Geophysics
93.00 Geophysical Observations, Instrumentation, and Techniques
94.00 Aeronomy and Space Physics
95.00 Fundamental Astronomy and Astrophysics, Instrumentation and Techniques and Astronomical Observations
96.00 Solar System
97.00 Stars
98.00 Stellar Systems; Galactic and Extragalactic Objects and Systems; The Universe
